DEPARTMENT OF COMPUTER SCIENCE AND ENGINEERING

IIT KHARAGPUR

Overview

- *Meghamala @IITKgp* on OpenStack Cloud
- VM Creation
- Accessing VM by User
- VM Termination

Meghamala

the IIT Kharagpur Cloud

Meghamala - a one stop solution to your computational needs.

The IIT Kharagpur cloud gives you compute and storage with one click.

Know more

Welcome to Meghamala!

Meghamala is an initiative by the Indian Institute of Technology, Kharagpur to provide on demand computational and storage resources to the institute research community. It is built using OpenStack Cloud Computing platform.

Meghamala has been set up in the Computer and Informatics Centre, IIT Kharagpur. The hardware of the system includes :

- Blade servers
- SAN Storage
- NAS

Please visit the various sections of this website to know more about Meghamala.

Latest News

MAR 23, 2016

MegHadoop

MegHadoop, a Hadoop cluster on Meghamala is up and available for use.

AUG 12, 2015

MeghaData

MeghaData, a data storage service is under beta testing.

APR 25, 2015

Inauguration

Inauguration and Workshop on Meghamala was carried out on 30th April 2015.

Services offered by Meghamala

Meghamala was conceptualized to address the computational needs of the research community at IIT Kharagpur.

To meet these demands, Meghamala offers the following services :

- **VMs4U -- Compute Nodes**
  Provision a virtual machine on demand and use it as a dekstop or run your workload on it. The following virtual machine configurations are available :
  - **IITKGP_regular**
    2 VCPUs
    4 GB RAM
    45 GB ephemeral storage
  - **IITKGP_large**
    4 VCPUs
    8 GB RAM
    45 GB ephemeral storage
  - **IITKGP_xLarge**
    8 VCPUs
    16 GB RAM
    60 GB ephemeral storage

  The virtual machines can have the following guest operating systems.
  - Ubuntu 14.04
  - Centos 7
  - Fedora 20
- **Storage on the House**
  - Persistent storage provided on request

Click here to request for a VM

- **MegHadooop**

Department

Designation

Phone/Mobile no.

E-mail

Purpose

Preferred VM Name

VM Type (•) IITKGP_regular ( ) IITKGP_large ( ) IITKGP_xlarge

Number of VMs 1

Operating system Ubuntu 14.04

Persistent storage of 20 GB required ( ) Yes (•) No

VM required till (max 60 days)

knyq5g

Enter the code above here

Can't read the image? click here to refresh

Please note that the VMs should be used only for academic purposes. Neither the Meghamala team nor IIT Kharagpur is responsible for the contents of your VMs. It is important to highlight that the presence of inappropriate material may lead to immediate termination of the VM(s).

Submit Query

Steps to follow

Fill out this form.
Fill out the form on the left and click on Submit.

Get hard copy signed.
Print the generated PDF and sign it. You may save a copy for future reference.

Submit signed hard copy.
Submit the signed hard copy to the professor-in-charge, Meghamala.

Meghamala team

- **Students**

  Current Members
  - Shubham Jain, 4th year Dual Degree (Computer Science and Engineering)
  - Shreyans Pagariya, 4th year Dual Degree (Computer Science and Engineering)
  - Arindam Roy, PhD Scholar (Advanced Technology Development Center)
  - Rajesh Basak, PhD Scholar (Computer Science and Engineering)
  - Debopriyo Banerjee, PhD Scholar (Computer Science and Engineering)
  - Chandan Misra, PhD Scholar (Advanced Technology Development Center)

  Past Members
  - Harshit Gupta, Dual Degree (Computer Science and Engineering)
  - Nikhil Agrawal, Dual Degree (Computer Science and Engineering)
  - Ashish Kale, M.Tech (Computer Science and Engineering)
  - Major Sujeet Deshmukh, M.Tech. (Information Technology)

- **CIC Engineers**
  - Alokes Chattopadhyay
  - Alok Baran Das

- **Faculty**
  - Soumya K. Ghosh (Dept. of Computer Science and Engineering)
  - Shamik Sural (Dept. of Computer Science and Engineering)

> We plan to add more team members as time progresses. After all, the key aim of the project remains to make people learn.

IIT KHARAGPUR

NPTEL ONLINE
CERTIFICATION COURSES

CLOUD COMPUTING

CREATE A PYTHON WEB APP IN MICROSOFT AZURE:

PROF. SOUMYA K. GHOSH
DEPARTMENT OF COMPUTER SCIENCE AND ENGINEERING
IIT KHARAGPUR

Microsoft Azure : An overview

- Microsoft Azure is a growing collection of integrated cloud services which developers and IT professionals use to build, deploy and manage applications through a global network of datacenters.

- With Azure, developers get the freedom to build and deploy wherever they want, using the tools, applications and frameworks of their choice.

Ref: https://azure.microsoft.com/en-in/

Deploy anywhere with your choice of tools

- Connecting cloud and on-premises with consistent hybrid cloud capabilities and using open source technologies

Ref: https://azure.microsoft.com/en-in/

Protect your business with the most trusted cloud

- Azure helps to protect assets through a rigorous methodology and focus on security, privacy, compliance and transparency.

Ref: https://azure.microsoft.com/en-in/

Accelerate app innovation

- Build simple to complex projects within a consistent portal experience using deeply-integrated cloud services, so developers can rapidly develop, deploy and manage their apps.

Ref: https://azure.microsoft.com/en-in/

Power decisions and apps with insights

- Uncover business insights with advanced analytics and data services for both traditional and new data sources. Detect anomalies, predict behaviors and recommend actions for your business.

Add intelligence to your apps

Predict and respond proactively

Support your strategy with any data

Ref: https://azure.microsoft.com/en-in/

In this demo, we are going to present the creation of a python web app in Microsoft Azure.

Ref: https://azure.microsoft.com/en-in/

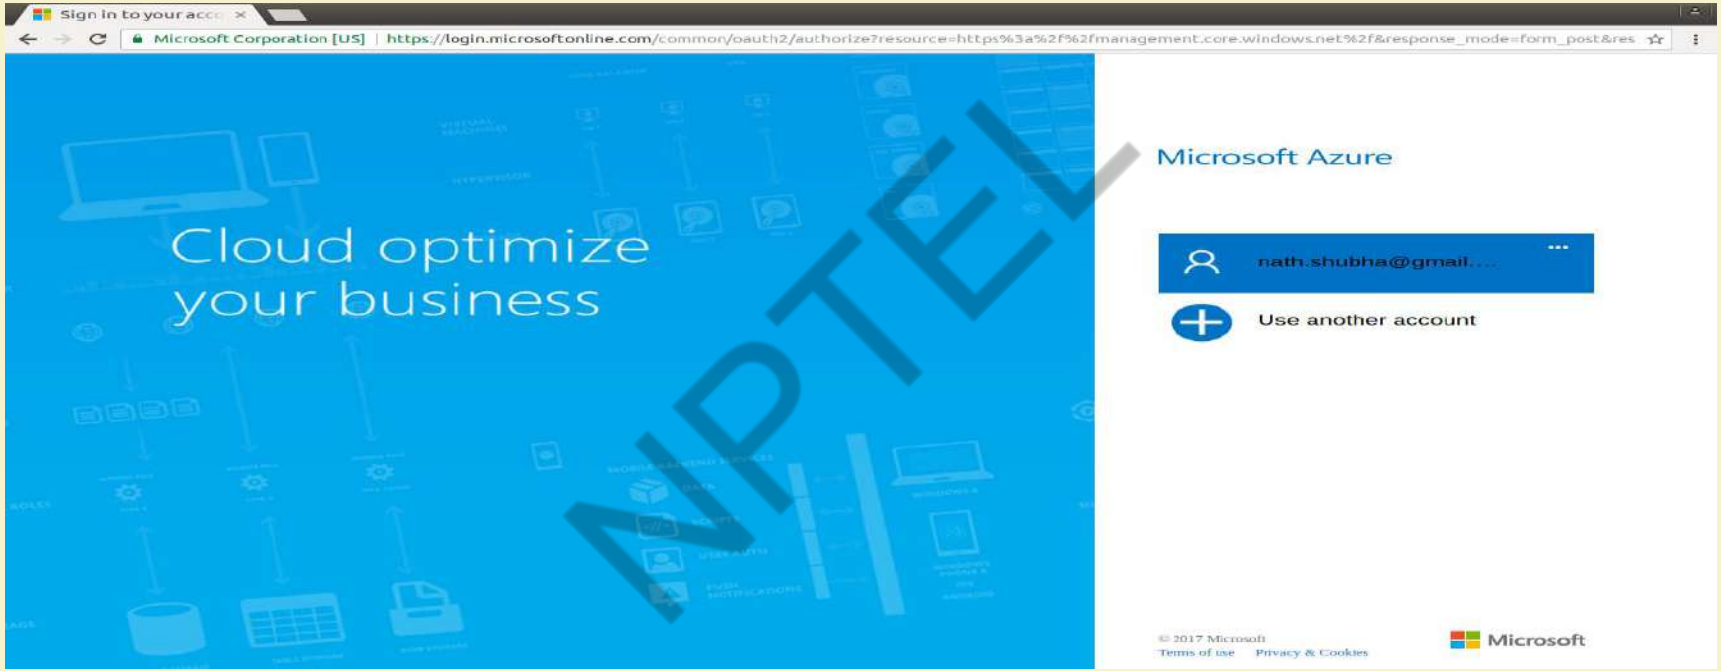
Azure Web Apps

- Highly scalable, Self-patching web hosting service.

- Prerequisites
  - ✓ To complete this demo:
    - ➔ Install Git
    - ➔ Install Python

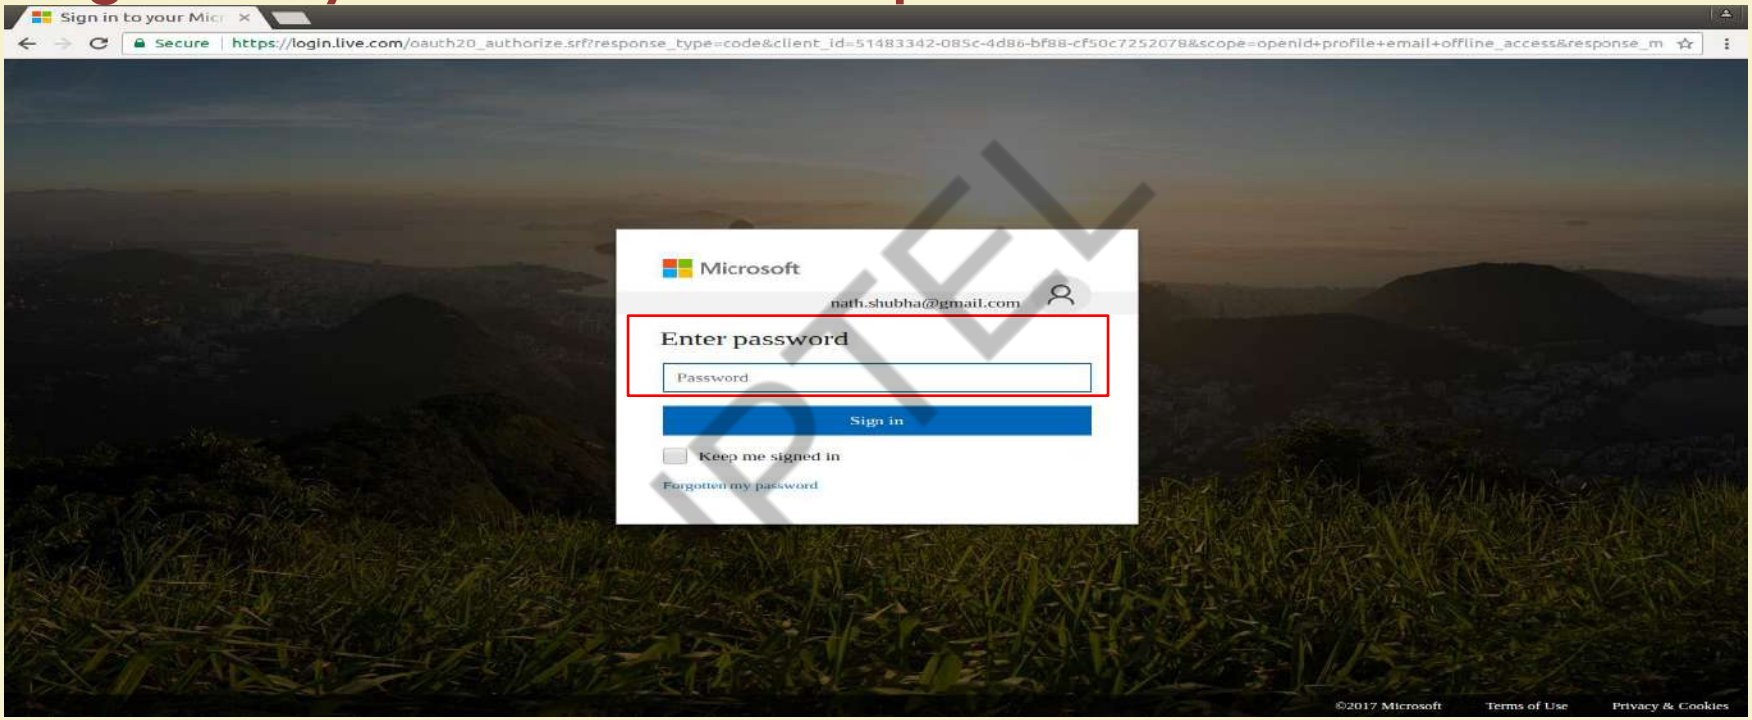
Ref: https://azure.microsoft.com/en-in/

Go to https://portal.azure.com/and login with your username and password



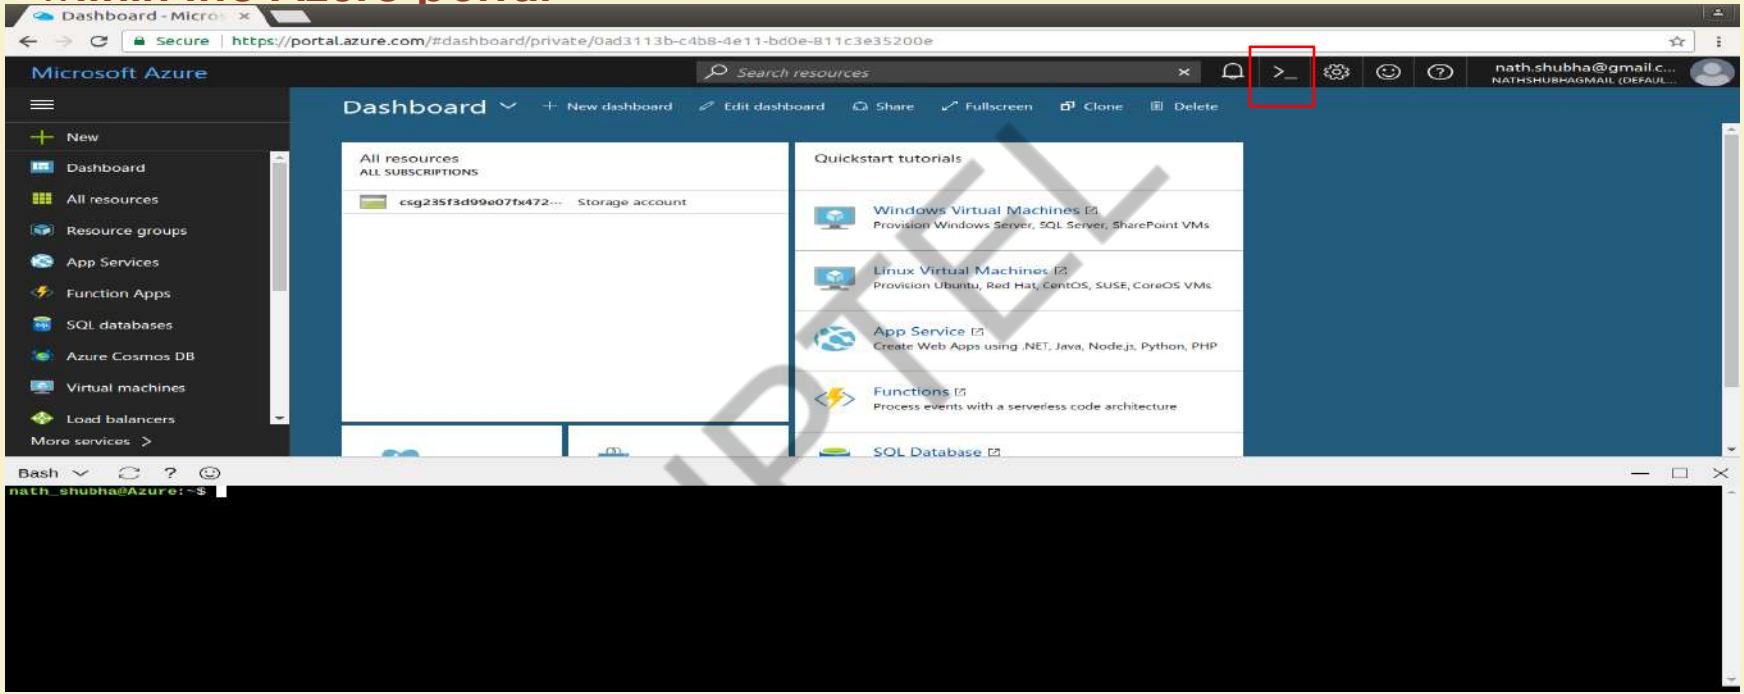
Ref: https://docs.microsoft.com/en-us/azure/app-service-web/app-service-web-get-started-python

Login with your username and password



Ref: https://docs.microsoft.com/en-us/azure/app-service-web/app-service-web-get-started-python

Launch Azure Cloud Shell : It is a free bash shell that we can directly use within the Azure portal



Ref: https://docs.microsoft.com/en-us/azure/app-service-web/app-service-web-get-started-python

Download the sample

In a terminal window, run the following command to clone the sample app repository to your local machine.

Ref: https://docs.microsoft.com/en-us/azure/app-service-web/app-service-web-get-started-python

Change to the directory that contains the sample code

Ref: https://docs.microsoft.com/en-us/azure/app-service-web/app-service-web-get-started-python

Install flask

```
root@shubha-OptiPlex-9020: /home/shubha/python-docs-hello-world
root@shubha-OptiPlex-9020:/home/shubha/python-docs-hello-world# pip install flask
Collecting flask
  Downloading Flask-0.12.2-py2.py3-none-any.whl (83kB)

Successfully installed Jinja2-2.9.6 MarkupSafe-1.0 Werkzeug-0.12.2 click-6.7 flask-0.12.2 itsdangerous-0.24
You are using pip version 8.1.1, however version 9.0.1 is available.
You should consider upgrading via the 'pip install --upgrade pip' command.
root@shubha-OptiPlex-9020:/home/shubha/python-docs-hello-world#
```

Ref: https://docs.microsoft.com/en-us/azure/app-service-web/app-service-web-get-started-python

Run the app locally

```
root@shubha-OptiPlex-9020: /home/shubha/python-docs-hello-world
root@shubha-OptiPlex-9020:/home/shubha/python-docs-hello-world# python main.py
 * Running on http://127.0.0.1:5000/ (Press CTRL+C to quit)
```

Ref: https://docs.microsoft.com/en-us/azure/app-service-web/app-service-web-get-started-python

Open a web browser, and navigate to the sample app at http://localhost:5000. You can see the Hello World message from the sample app displayed in the page.

Ref: https://docs.microsoft.com/en-us/azure/app-service-web/app-service-web-get-started-python

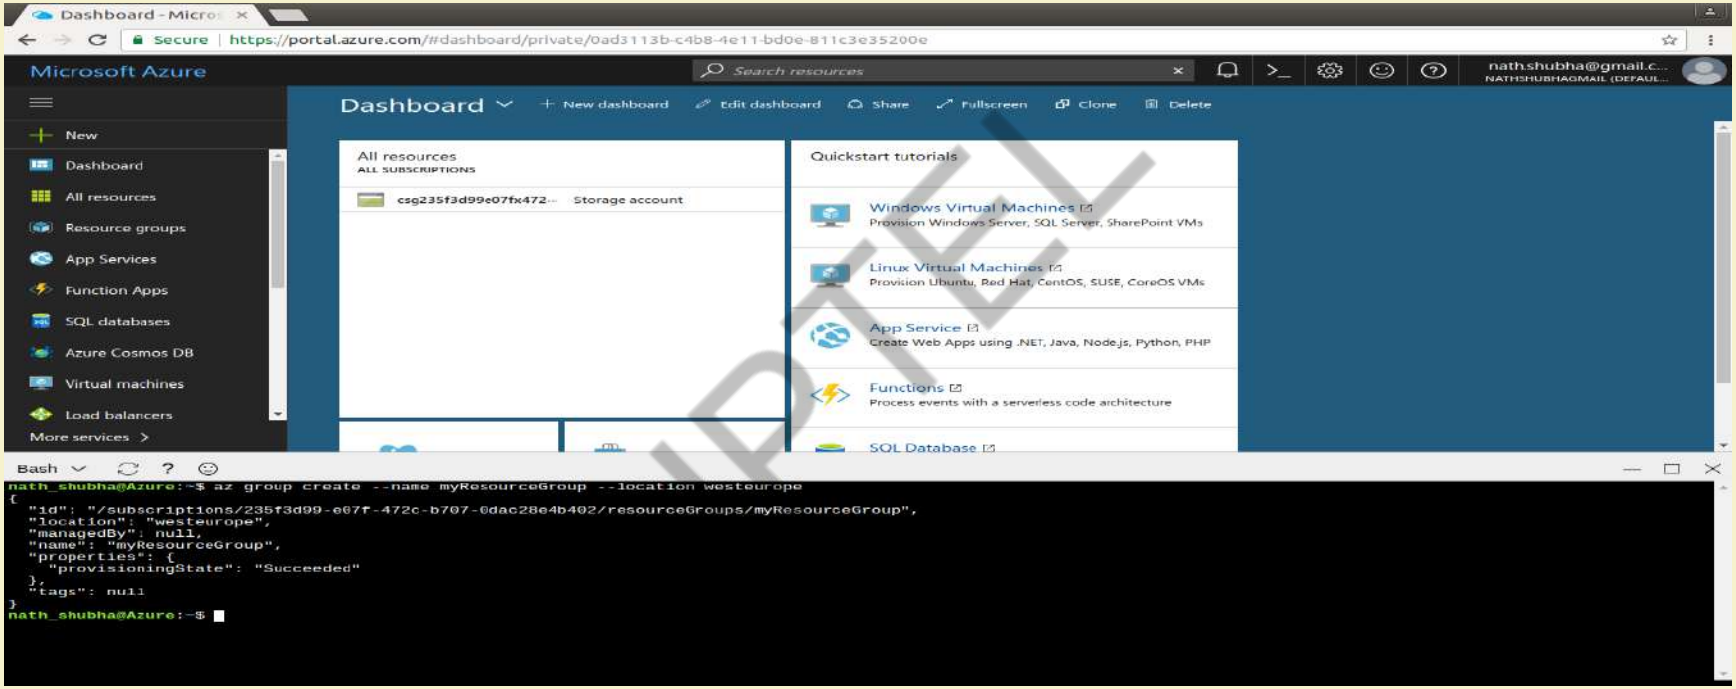
Configure a deployment user using the command

- A deployment user is required for FTP and local Git deployment to a web app.

az webapp deployment user set --user-name <username> --password <password>

Ref: https://docs.microsoft.com/en-us/azure/app-service-web/app-service-web-get-started-python

Create a resource group: A resource group is a logical container into which Azure resources like web apps, databases, and storage accounts are deployed and managed.



Ref: https://docs.microsoft.com/en-us/azure/app-service-web/app-service-web-get-started-python

Create an Azure App Service plan

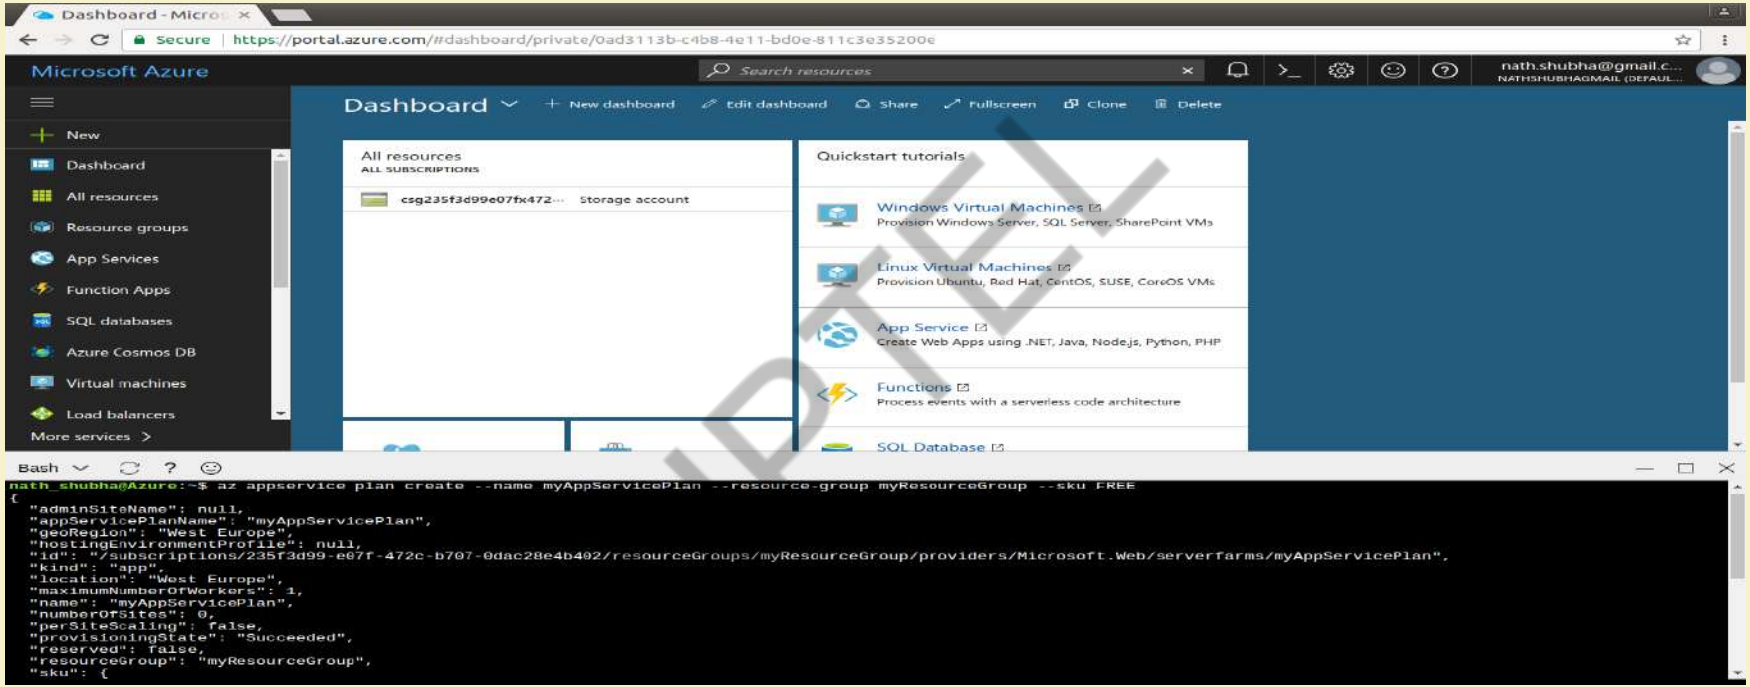
- An App Service plan specifies the location, size, and features of the web server farm that hosts your app. You can save money when hosting multiple apps by configuring the web apps to share a single App Service plan.

- App Service plans define:

    - Region (for example: North Europe, East US, or Southeast Asia)
    - Instance size (small, medium, or large)
    - Scale count (1 to 20 instances)
    - SKU (Free, Shared, Basic, Standard, or Premium)

Ref: https://docs.microsoft.com/en-us/azure/app-service-web/app-service-web-get-started-python

Create an Azure App Service plan



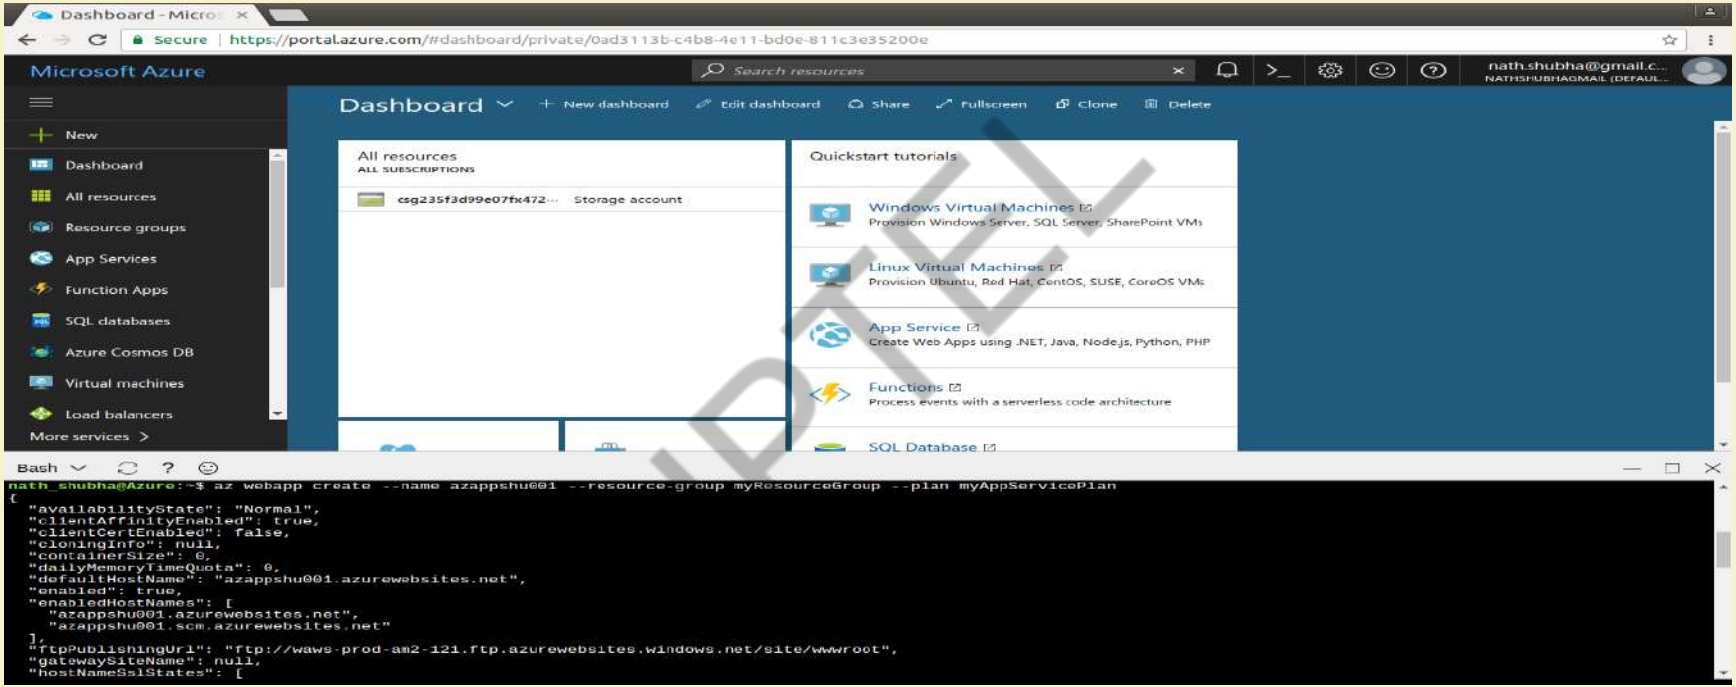
Ref: https://docs.microsoft.com/en-us/azure/app-service-web/app-service-web-get-started-python

Create a web app

- The web app provides a hosting space for your code and provides a URL to view the deployed app.

Ref: https://docs.microsoft.com/en-us/azure/app-service-web/app-service-web-get-started-python

Create a web app

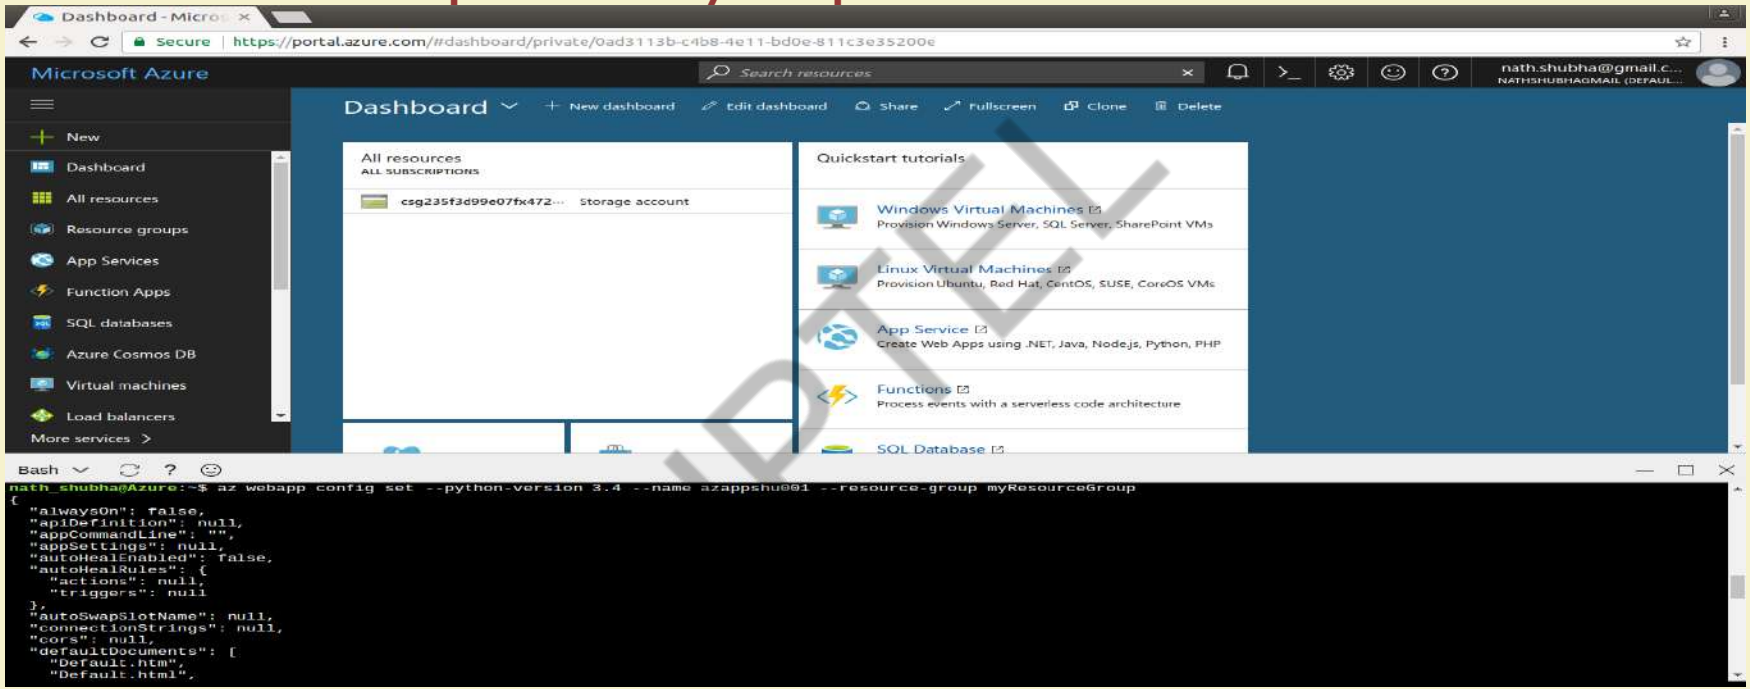


Ref: https://docs.microsoft.com/en-us/azure/app-service-web/app-service-web-get-started-python

Browse to the site azappshu001.azurewebsites.net to see your newly created web app.

Ref: https://docs.microsoft.com/en-us/azure/app-service-web/app-service-web-get-started-python

Configure to use Python: Setting the Python version this way uses a default container provided by the platform.



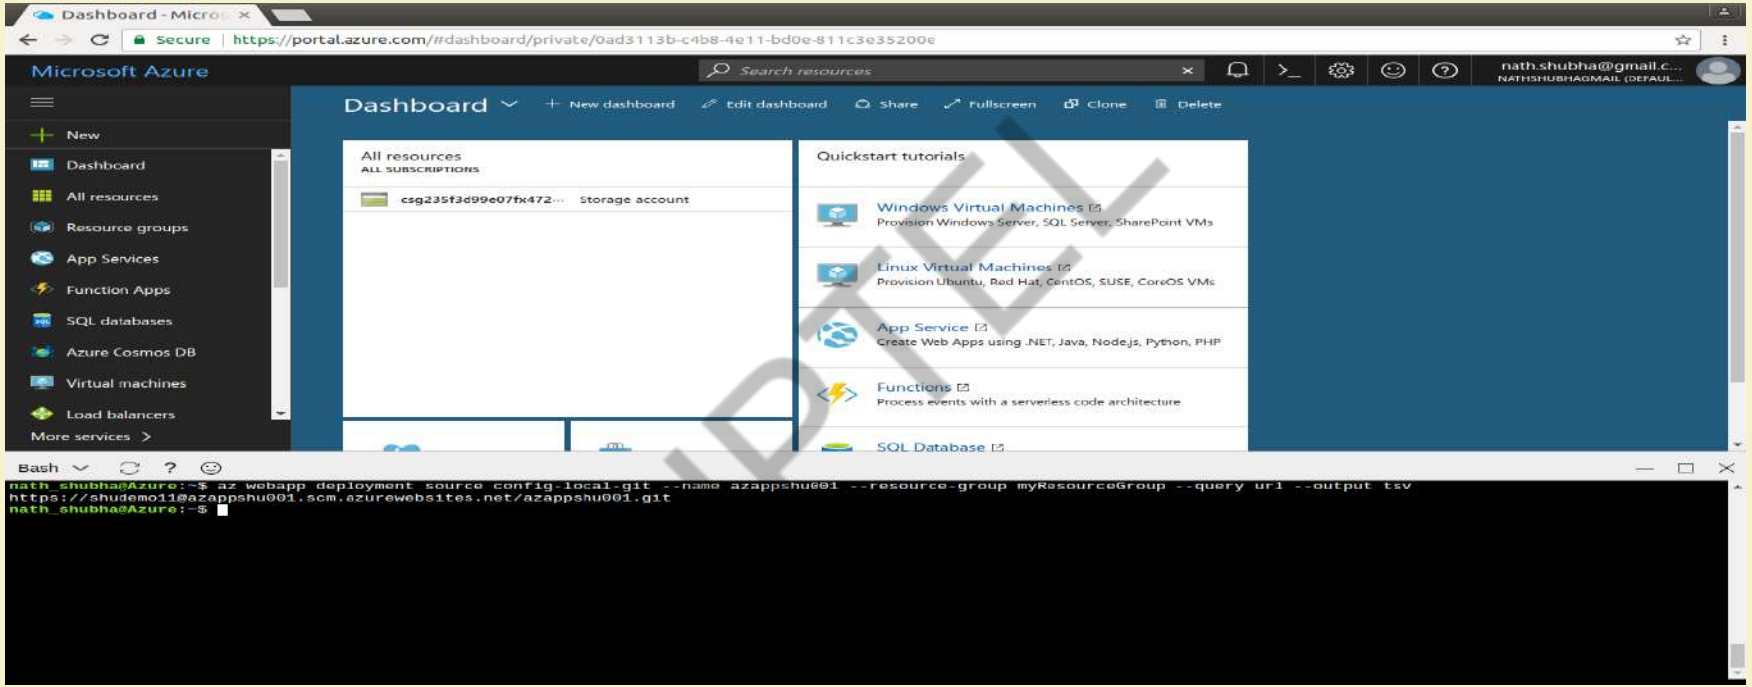
Ref: https://docs.microsoft.com/en-us/azure/app-service-web/app-service-web-get-started-python

Configure local Git deployment

- App Service supports several ways to deploy content to a web app, such as FTP, local Git, GitHub, Visual Studio Team Services, and Bitbucket. For this quickstart, you deploy by using local Git. That means you deploy by using a Git command to push from a local repository to a repository in Azure.

Ref: https://docs.microsoft.com/en-us/azure/app-service-web/app-service-web-get-started-python

Configure local Git deployment



Ref: https://docs.microsoft.com/en-us/azure/app-service-web/app-service-web-get-started-python

Push to Azure from Git: Add an Azure remote to your local Git repository.

```
root@shubha-OptiPlex-9020: /home/shubha/python-docs-hello-world
root@shubha-OptiPlex-9020:/home/shubha/python-docs-hello-world# git remote add azure https://shudemo11@azappshu001.scm.azurewebsites.net/azappshu001.git
root@shubha-OptiPlex-9020:/home/shubha/python-docs-hello-world#
```

Ref: https://docs.microsoft.com/en-us/azure/app-service-web/app-service-web-get-started-python

Push to the Azure remote to deploy your app. You are prompted for the password you created earlier when you created the deployment user. Make sure that you enter the password you created in Configure a deployment user, not the password you use to log in to the Azure portal.

Ref: https://docs.microsoft.com/en-us/azure/app-service-web/app-service-web-get-started-python

Browse to the app at azappshu001.azurewebsites.net

Ref: https://docs.microsoft.com/en-us/azure/app-service-web/app-service-web-get-started-python

Update and redeploy the code

Ref: https://docs.microsoft.com/en-us/azure/app-service-web/app-service-web-get-started-python

Using a local text editor, open the main.py file in the Python app, and make a small change

Ref: https://docs.microsoft.com/en-us/azure/app-service-web/app-service-web-get-started-python

Commit your changes in Git

```
root@shubha-OptiPlex-9020: /home/shubha/python-docs-hello-world
root@shubha-OptiPlex-9020:/home/shubha/python-docs-hello-world# git commit -am "updated output"
[master 17a5143] updated output
 1 file changed, 1 insertion(+), 1 deletion(-)
root@shubha-OptiPlex-9020:/home/shubha/python-docs-hello-world#
```

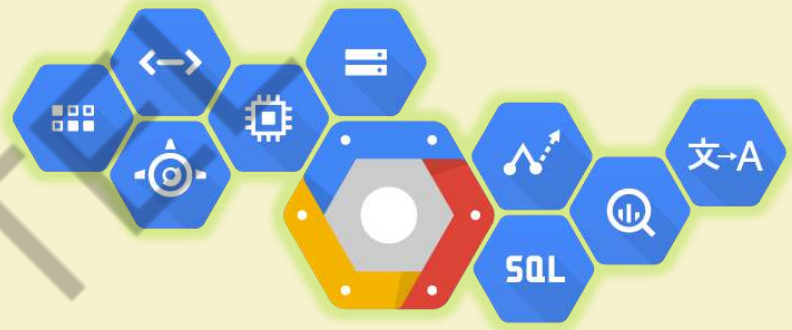
Google Cloud Platform (GCP)

Prof. Soumya K Ghosh
Department of Computer Science and Engineering
IIT KHARAGPUR

What's Google Cloud Platform?

- **Google Cloud Platform** is a set of services that enables developers to **build**, **test** and **deploy** applications on Google's reliable infrastructure.

- **Google cloud platform** is a set of modular cloud-based services that allow you to create anything from simple websites to complex applications



Google Cloud Platform

Google Cloud Platform Services!

Why Google Cloud Platform?

Run on Google's Infrastructure

Build on the same infrastructure that allows Google to return billions of search results in milliseconds, serve 6 billion hours of YouTube video per month and provide storage for 425 million Gmail users.

- ✓ Global Network
- ✓ Redundancy
- ✓ Innovative Infrastructure

Why Google Cloud Platform? (contd..)

Focus on your product

Rapidly develop, deploy and iterate your applications without worrying about system administration. Google manages your application, database and storage servers so you don't have to.

- ✓ Managed services
- ✓ Developer Tools and SDKs
- ✓ Console and Administration

Why Google Cloud Platform? (contd..)

Mix and Match Services

Virtual machines. Managed platform. Blob storage. Block storage. NoSQL datastore. MySQL database. Big Data analytics. Google Cloud Platform has all the services your application architecture needs.

- ✓ Compute
- ✓ Storage
- ✓ Services

Why Google Cloud Platform? (contd..)

Scale to millions of users

Applications hosted on Cloud Platform can automatically scale up to handle the most demanding workloads and scale down when traffic subsides. You pay only for what you use.

Scale-up: Cloud Platform is designed to scale like Google's own products, even when you experience a huge traffic spike. Managed services such as App Engine or Cloud Datastore give you auto-scaling that enables your application to grow with your users.

Scale-down: Just as Cloud Platform allows you to scale-up, managed services also scale down. You don't pay for computing resources that you don't need.

Why Google Cloud Platform? (contd..)

Performance you can count on

Google's compute infrastructure gives you consistent CPU, memory and disk performance. The network and edge cache serve responses rapidly to your users across the world.

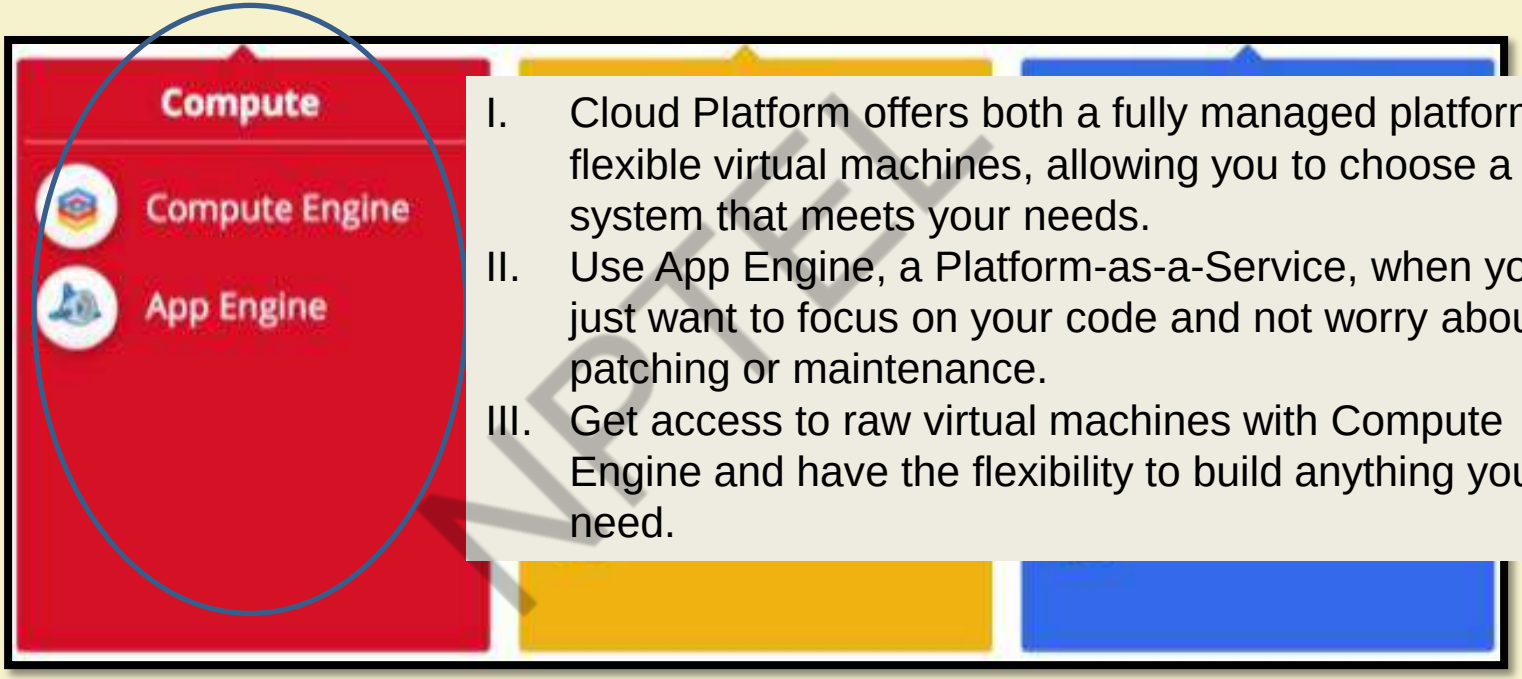
- ✓ CPU, Memory and Disk
- ✓ Global Network
- ✓ Transparent maintenance

Why Google Cloud Platform? (contd..)

Get the support you need

With a worldwide community of users, partner ecosystem and premium support packages, Google provides a full range of resources to help you get started and grow.

Google Cloud Platform Services

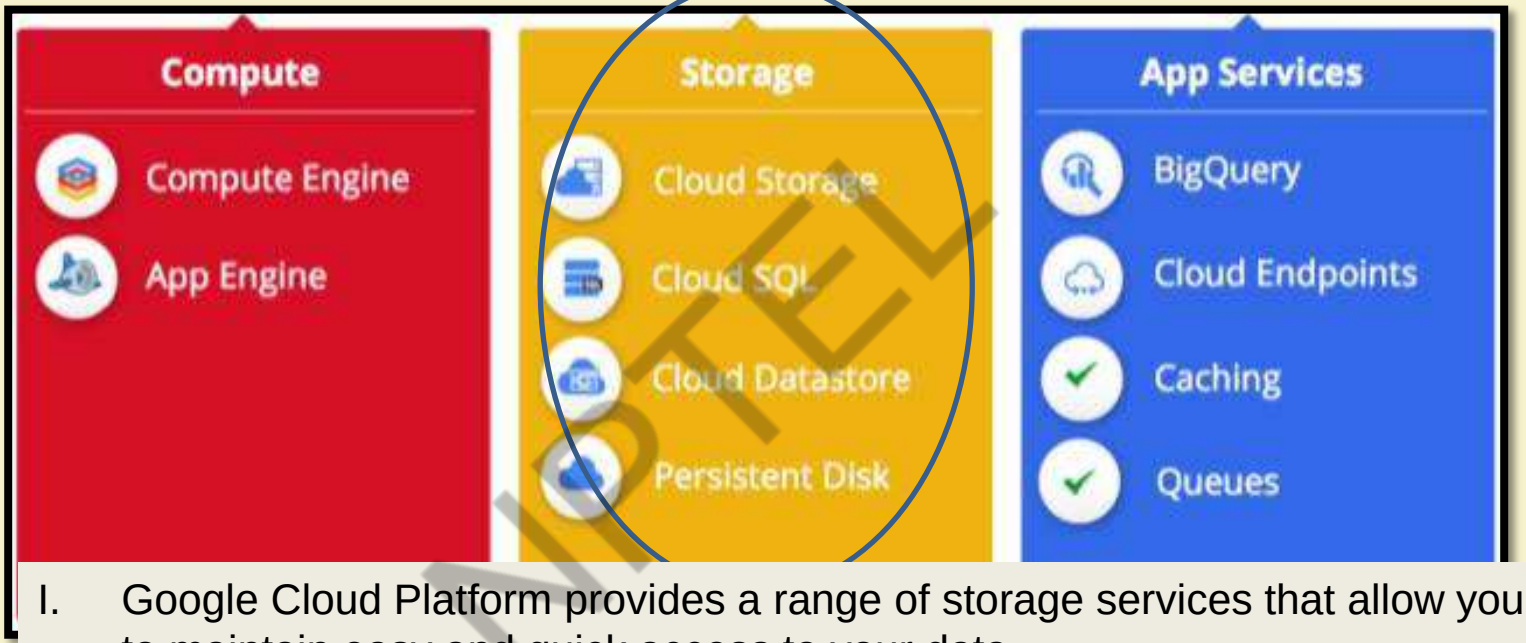


I. Cloud Platform offers both a fully managed platform and flexible virtual machines, allowing you to choose a system that meets your needs.

II. Use App Engine, a Platform-as-a-Service, when you just want to focus on your code and not worry about patching or maintenance.

III. Get access to raw virtual machines with Compute Engine and have the flexibility to build anything you need.

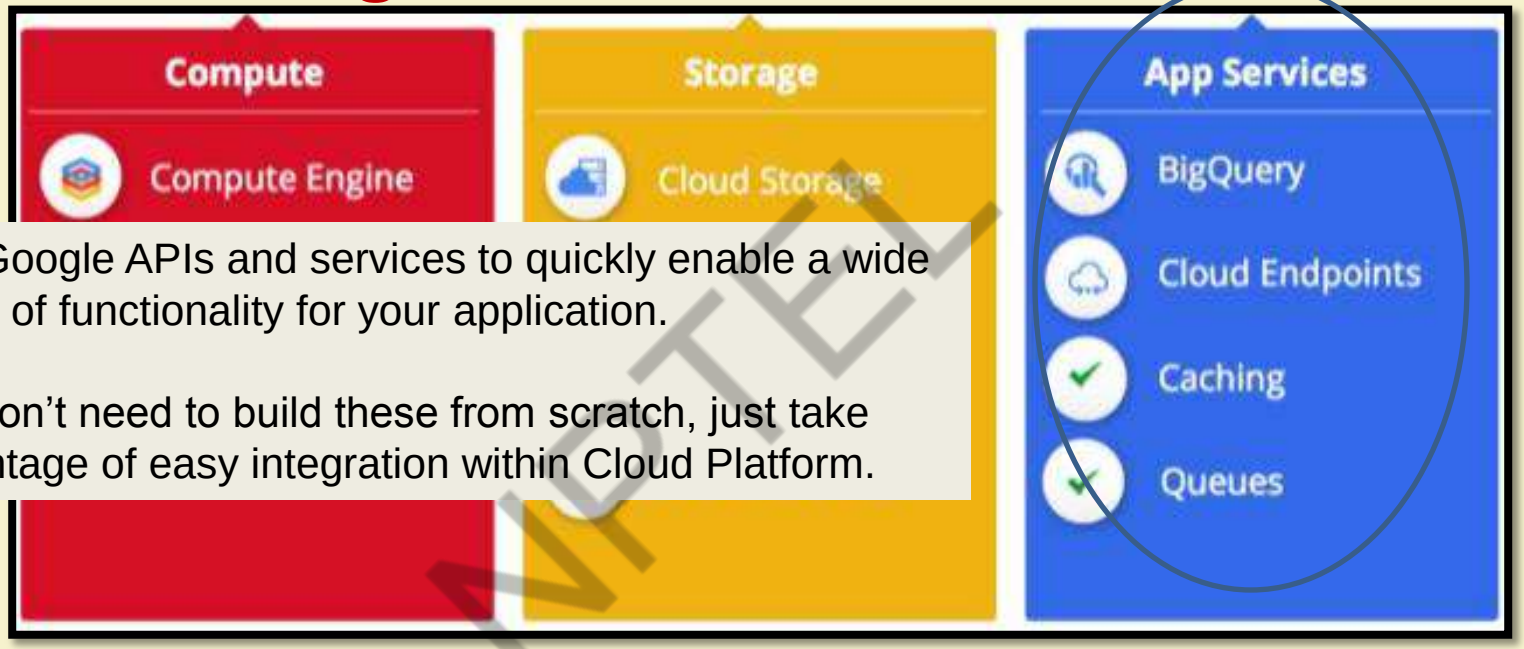
Google Cloud Platform Services



I. Google Cloud Platform provides a range of storage services that allow you to maintain easy and quick access to your data.

II. With **Cloud SQL** and **Datastore** you get MySQL or NoSQL databases, while **Cloud Storage** provides flexible object storage with global edge caching.

Google Cloud Platform Services



I. Use Google APIs and services to quickly enable a wide range of functionality for your application.

II. You don't need to build these from scratch, just take advantage of easy integration within Cloud Platform.

Google Cloud Platform Services – from User end!

- Consider to migrate your web application to Google Cloud Platform for better performance using **GoogleAppEngine.**
- Your application should go wherever your users go: Scale your application using **GoogleCloudEndpoints**.
- Integrate Google's services into your Application using **GoogleAPIs**.

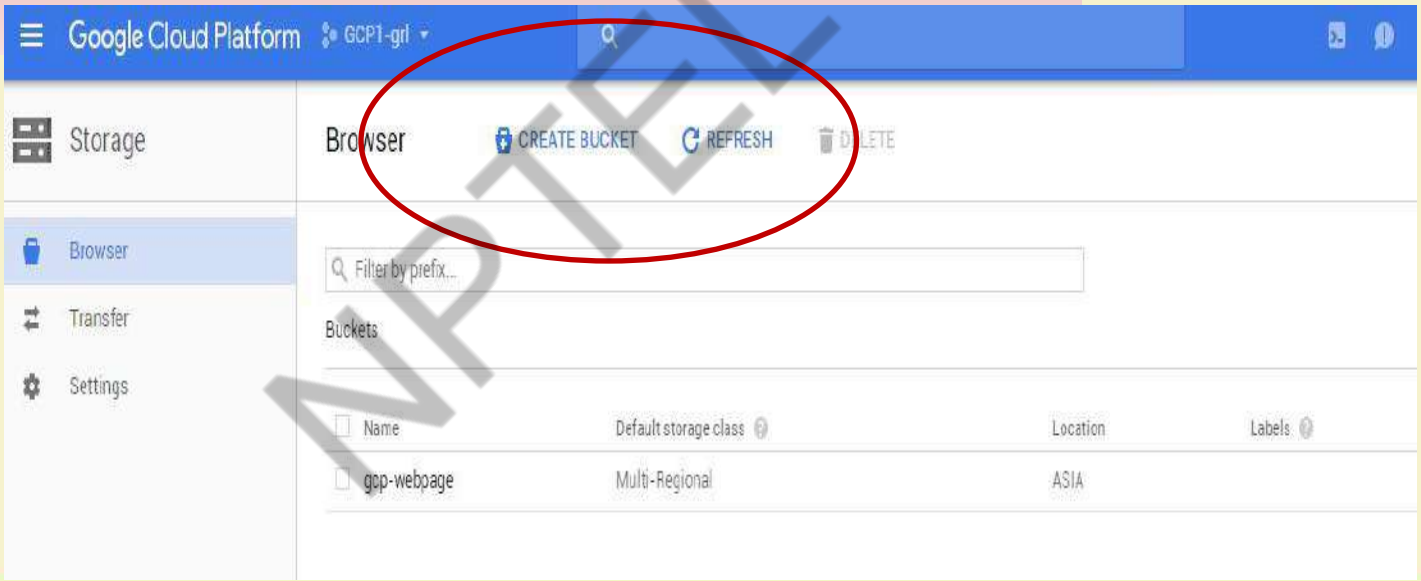
Example 1: Host your *web-page* in *Google Cloud Platform*

Example 2: Build your *web-app* using *Google App Engine*

Example 1: Host your *web-page* in *Google Cloud Platform*

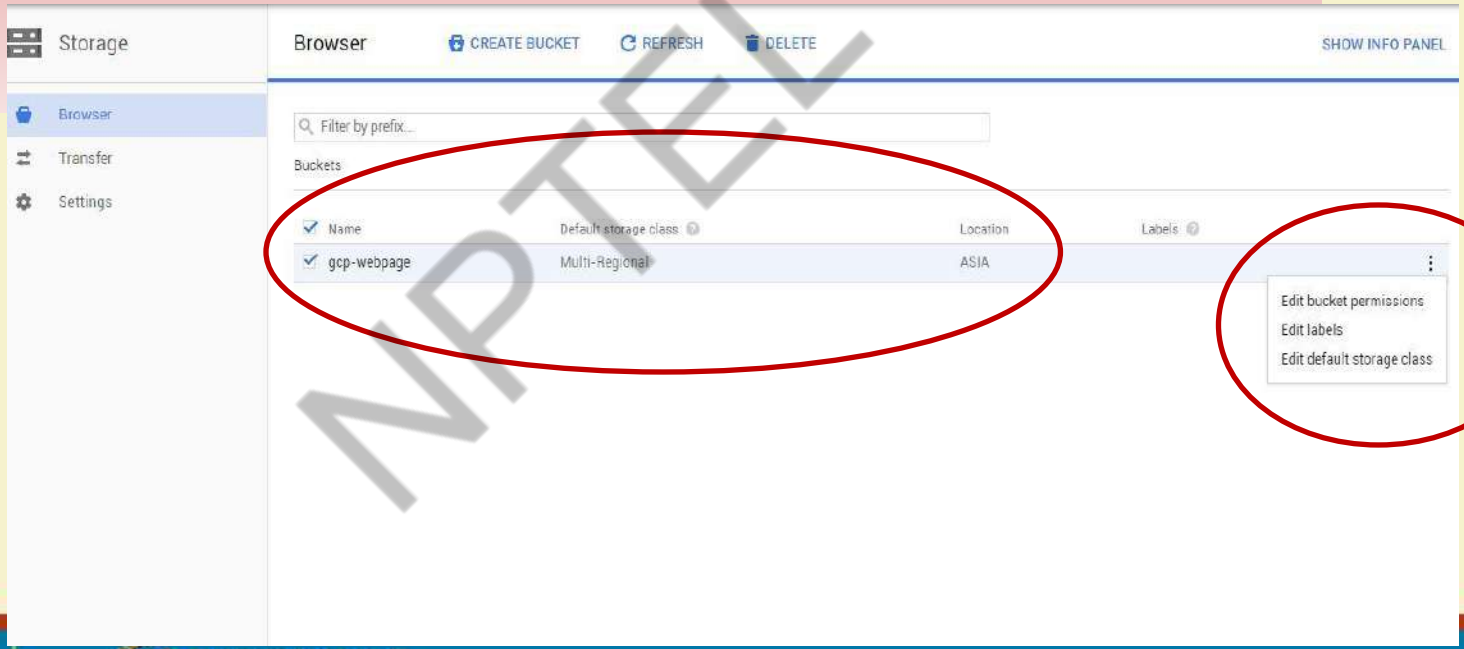
An easy example: Host your *web-page* inside *Google Cloud Platform*

i) Open the Cloud Storage browser in the Google Cloud Platform Console & click on ***Create Bucket***



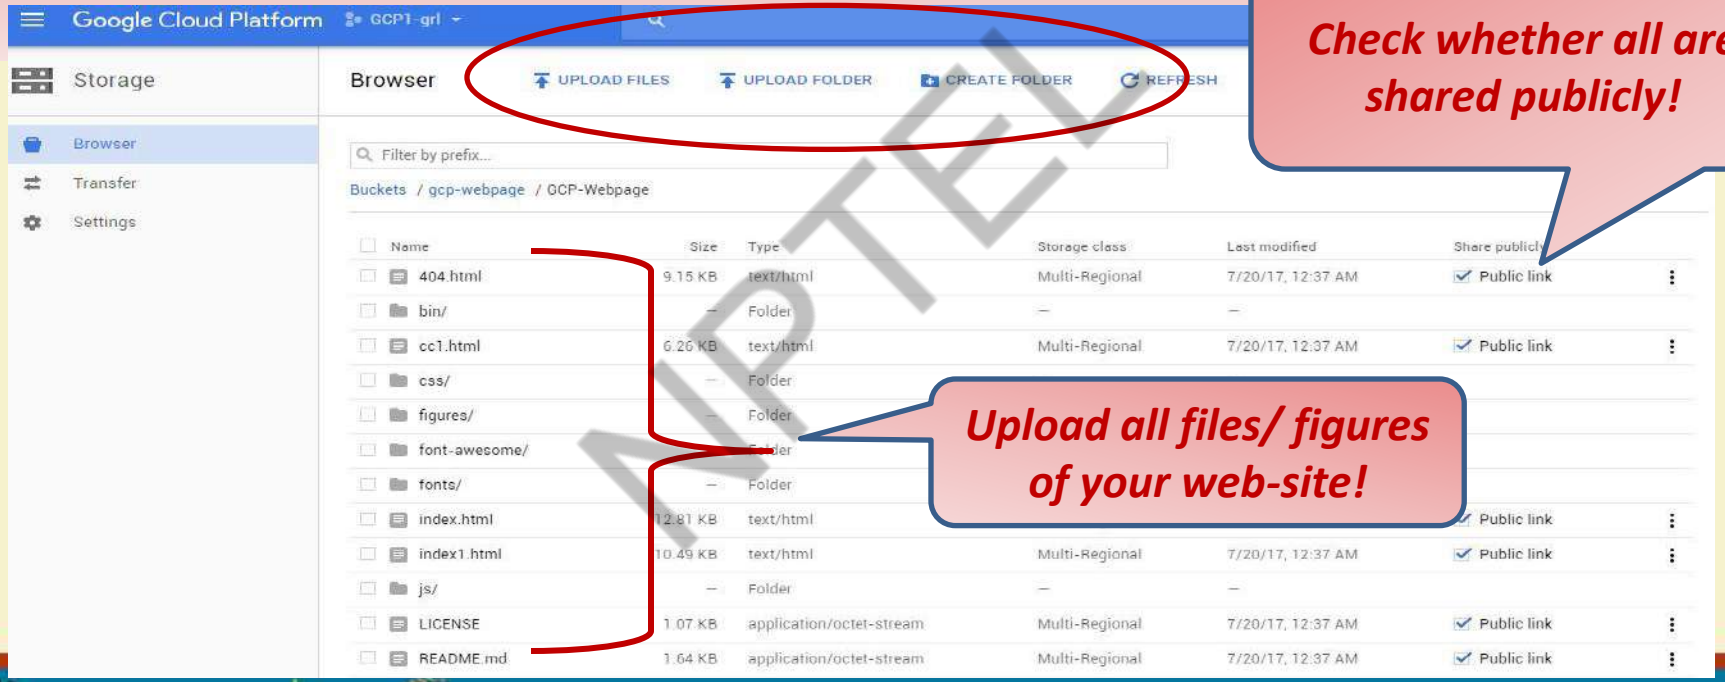
An easy example: Host your *web-page* inside *Google Cloud Platform*

ii) In the list of buckets, find the bucket you created.
And Click the more actions icon next to the bucket and select **Edit configuration**.



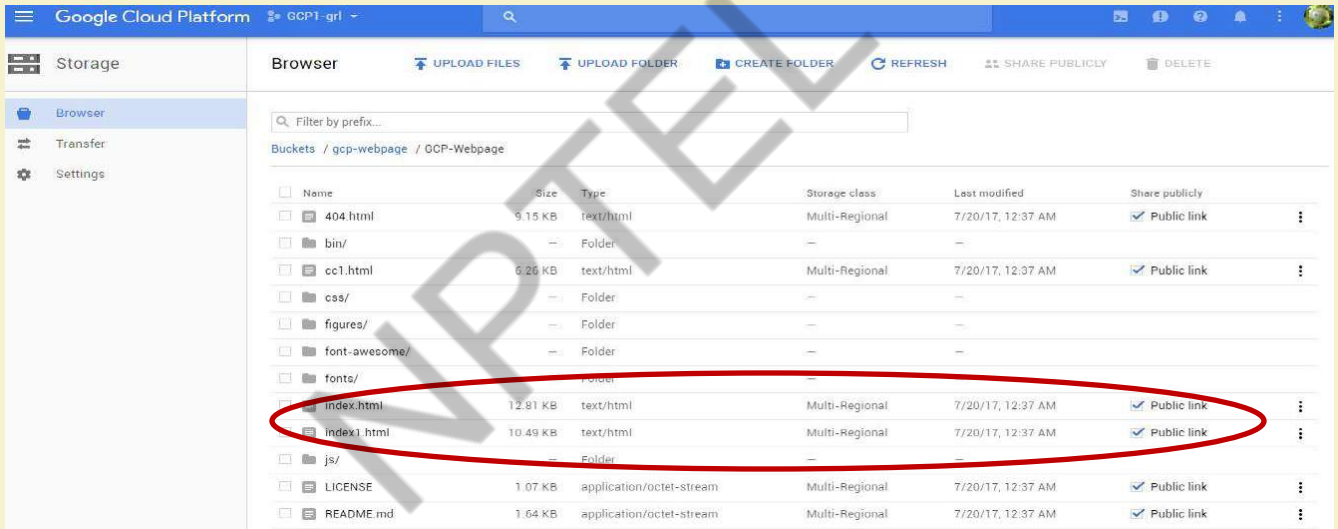
An easy example: Host your *web-page* inside *Google Cloud Platform*

iii) In the **Configure website** dialog, specify the **Main Page** and the **404 (Not Found) Page** or even your web-site folder!

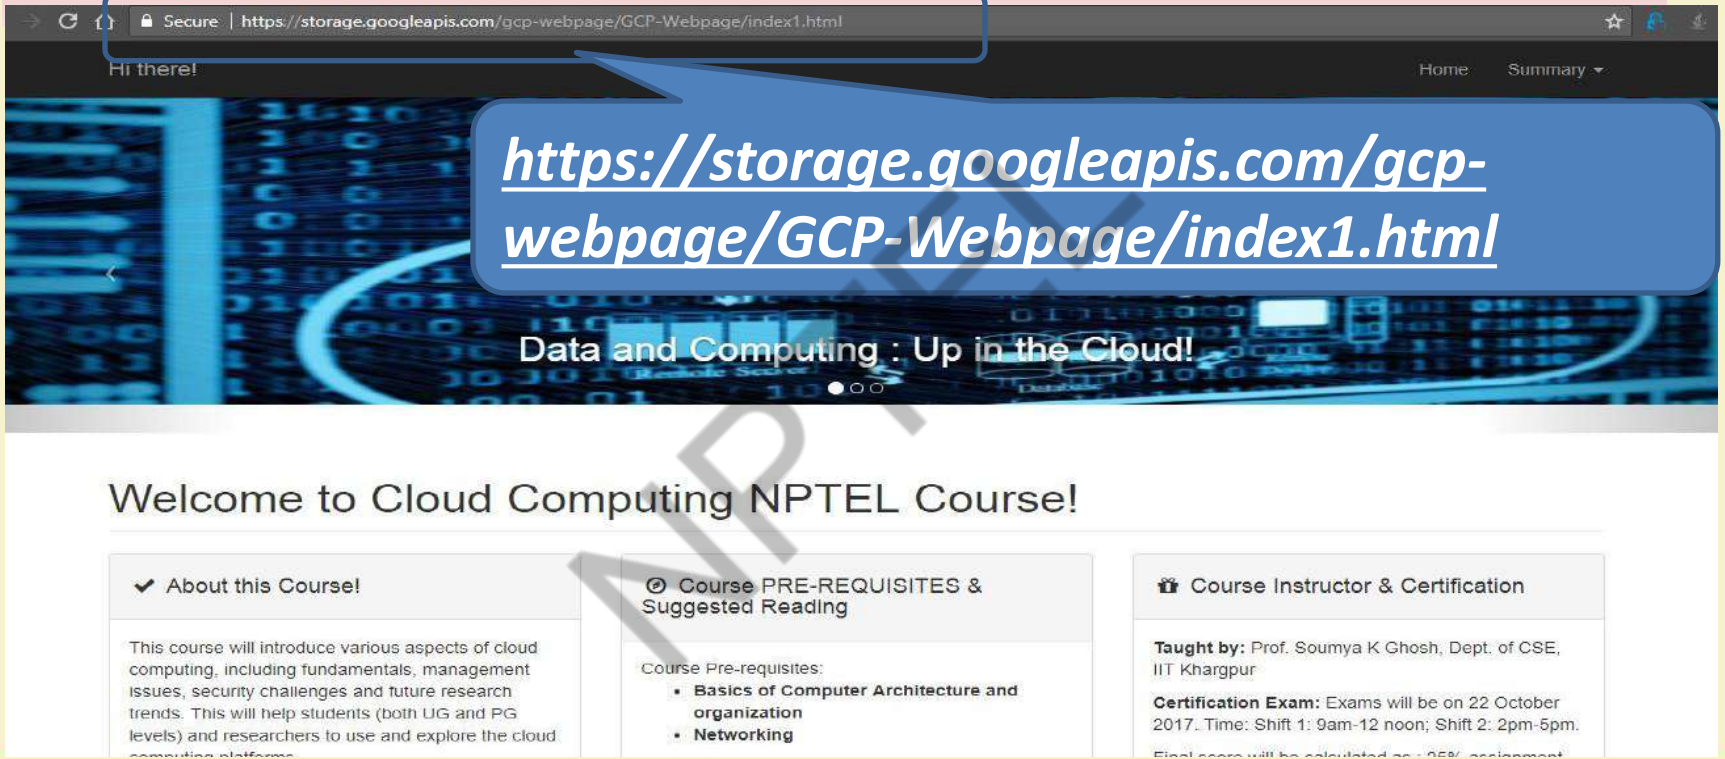


An easy example: Host your *web-page* inside *Google Cloud Platform*

iv) Get the public link of your html of home-page or ***index.html***



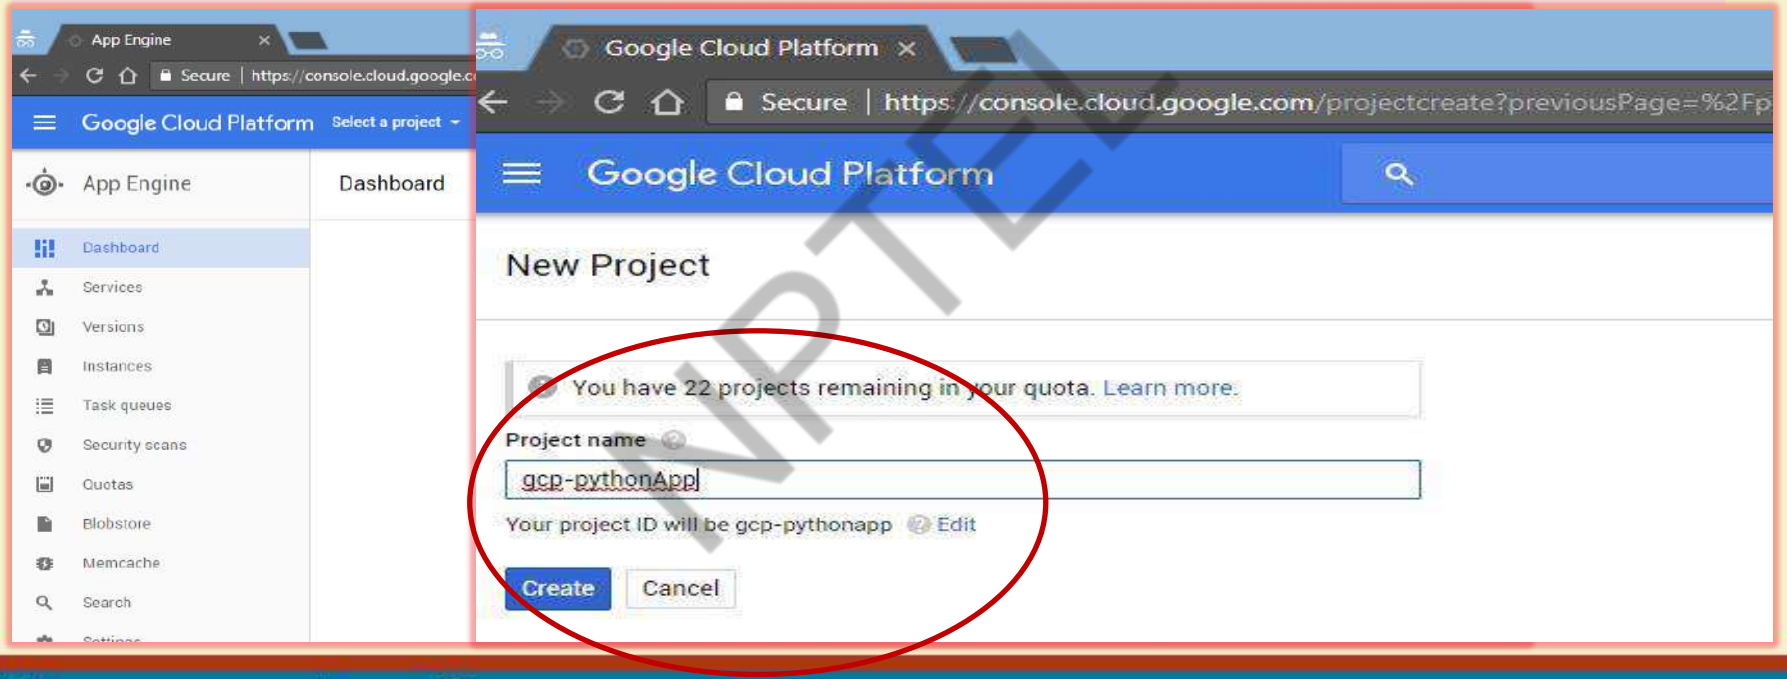
And you are ready to go! ☺



Example 2: Build your *web-app* using *Google App Engine*

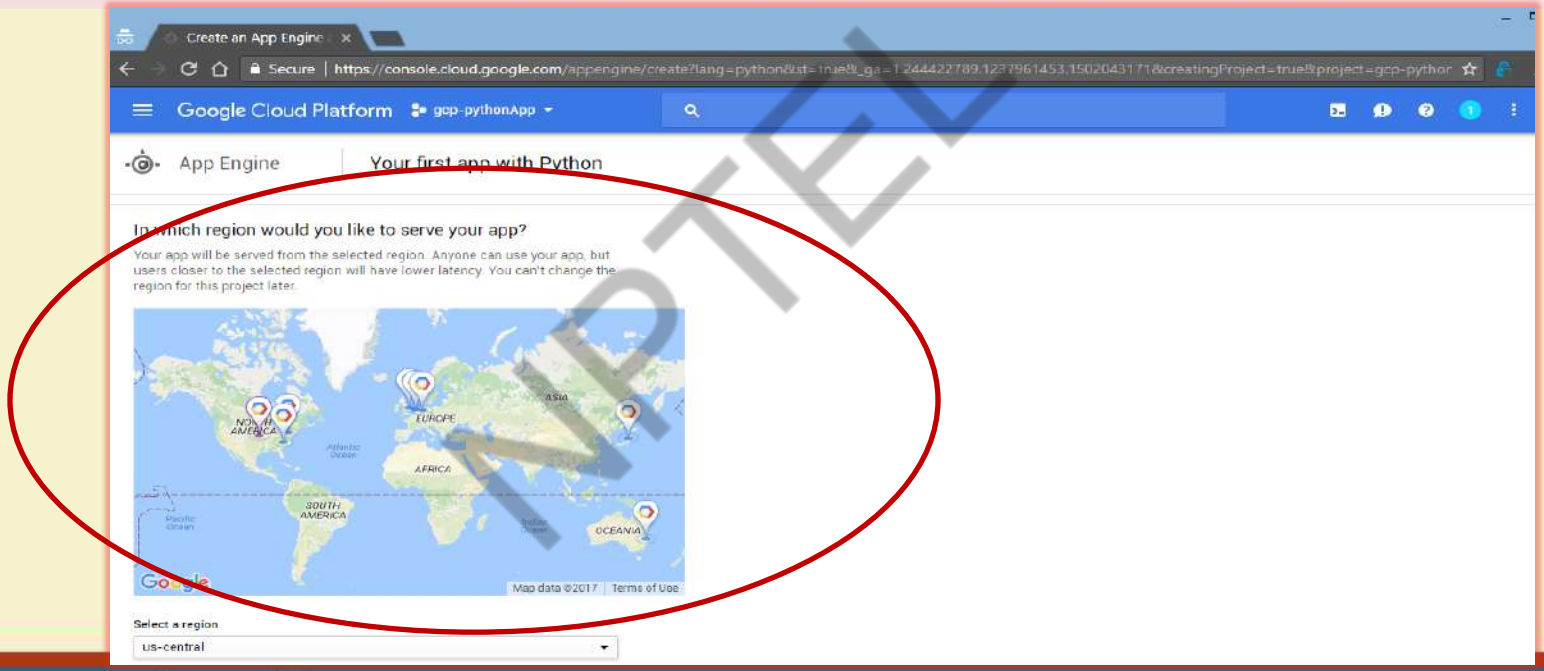
Another example: Host your *web-app* using *Google App Engine*

i) Open the Google Cloud Platform Console & create a new project using ***Cloud Platform project and App Engine application***



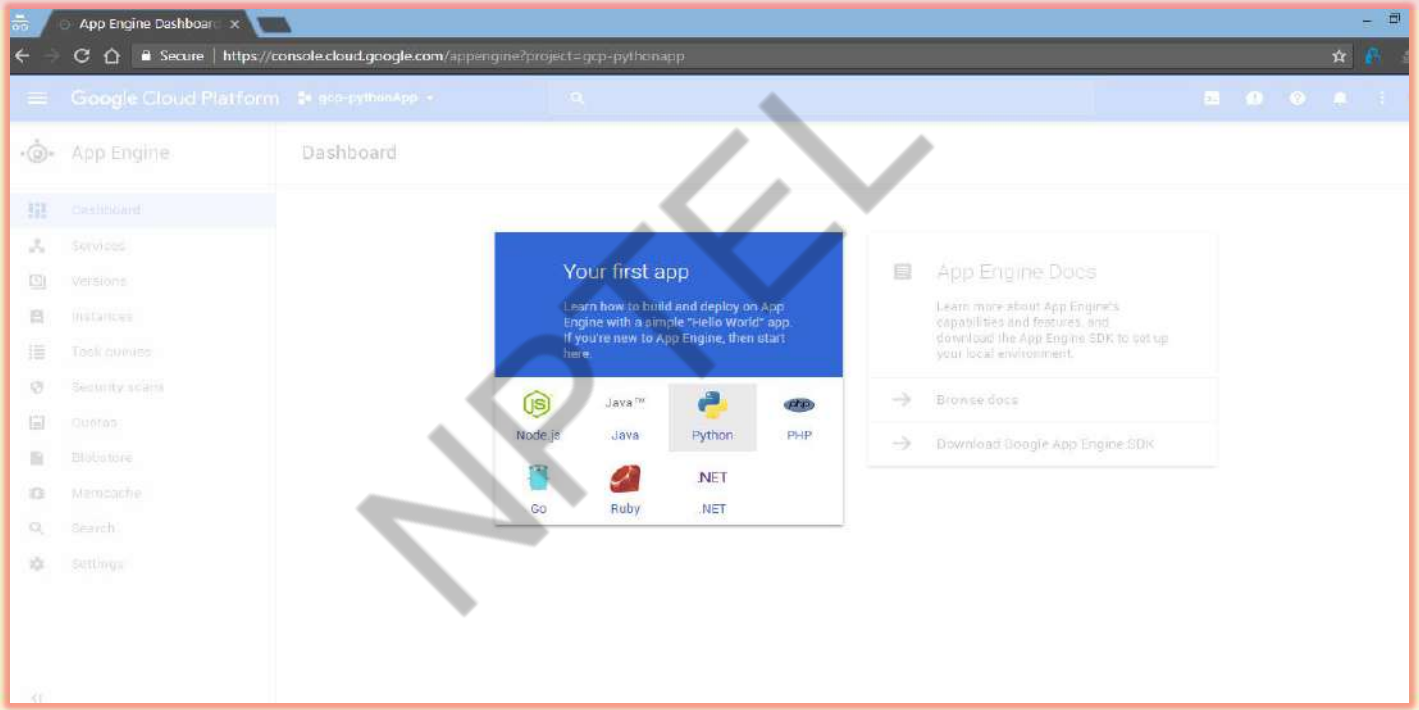
Another example: Host your *web-app* using *Google App Engine*

ii) When prompted, select the ***region*** where you want your App Engine application located.

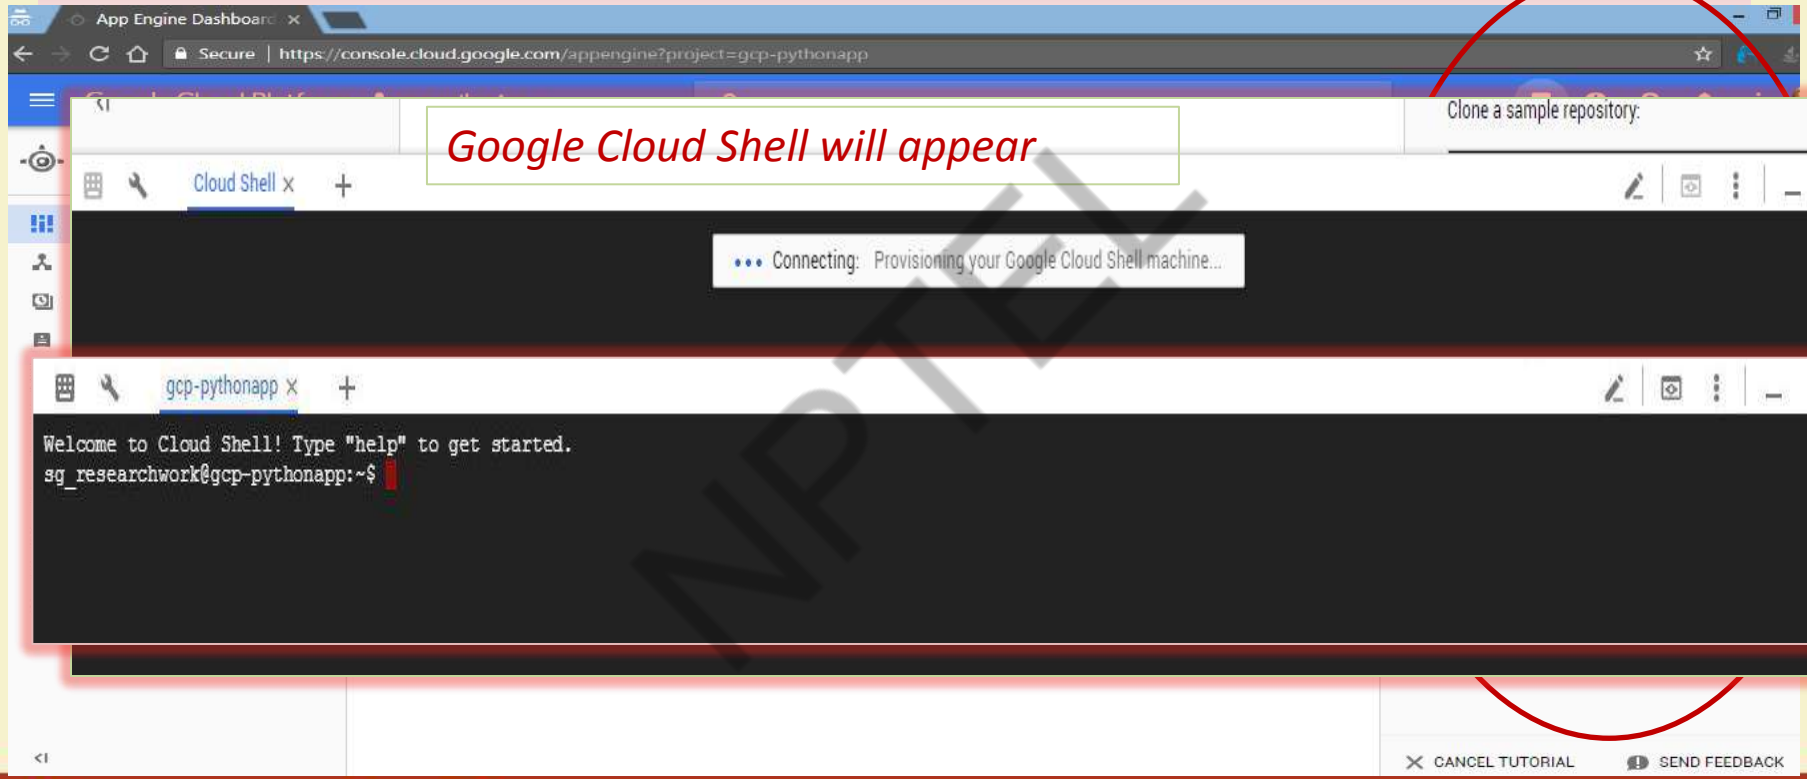


Another example: Host your *web-app* using *Google App Engine*

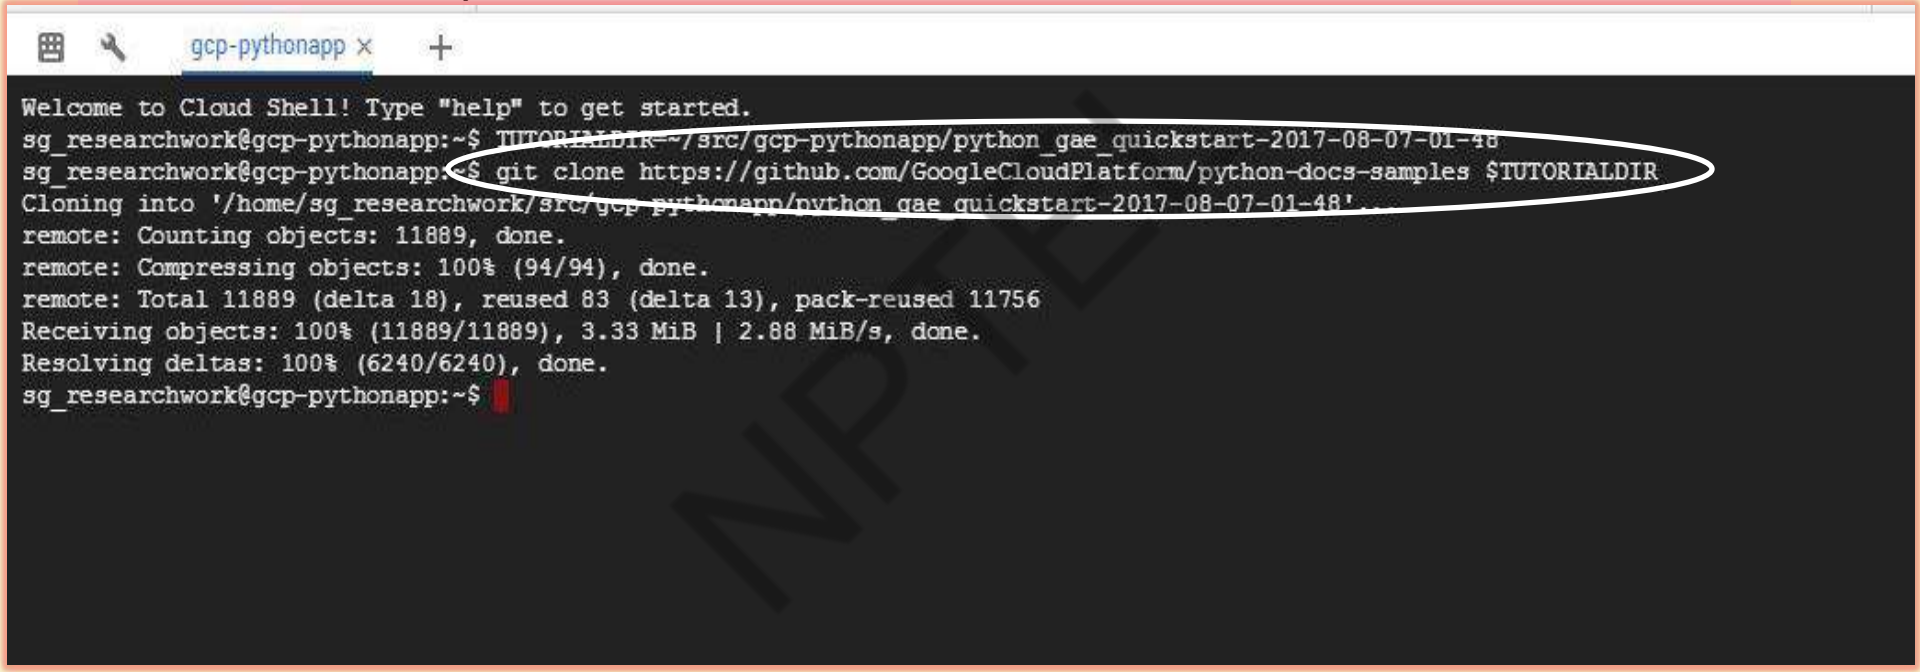
iii) Select your preferred programming language to build your app.



iv) Activate your ***Google Cloud Shell*** .



v) Clone the Hello World sample app repository and go to the directory that contains the sample code



v) Each application must contain ‘app.yaml’ and code base ‘main.py’ [with Flask web app deployment]

```
sg_research
sg_research
runtime: py
api_version
threadsafe:

handlers:
- url: /.*
  script: m
sg_research
```

gcp-pythonapp ×

```
# you may not use this file except in compliance with the License.

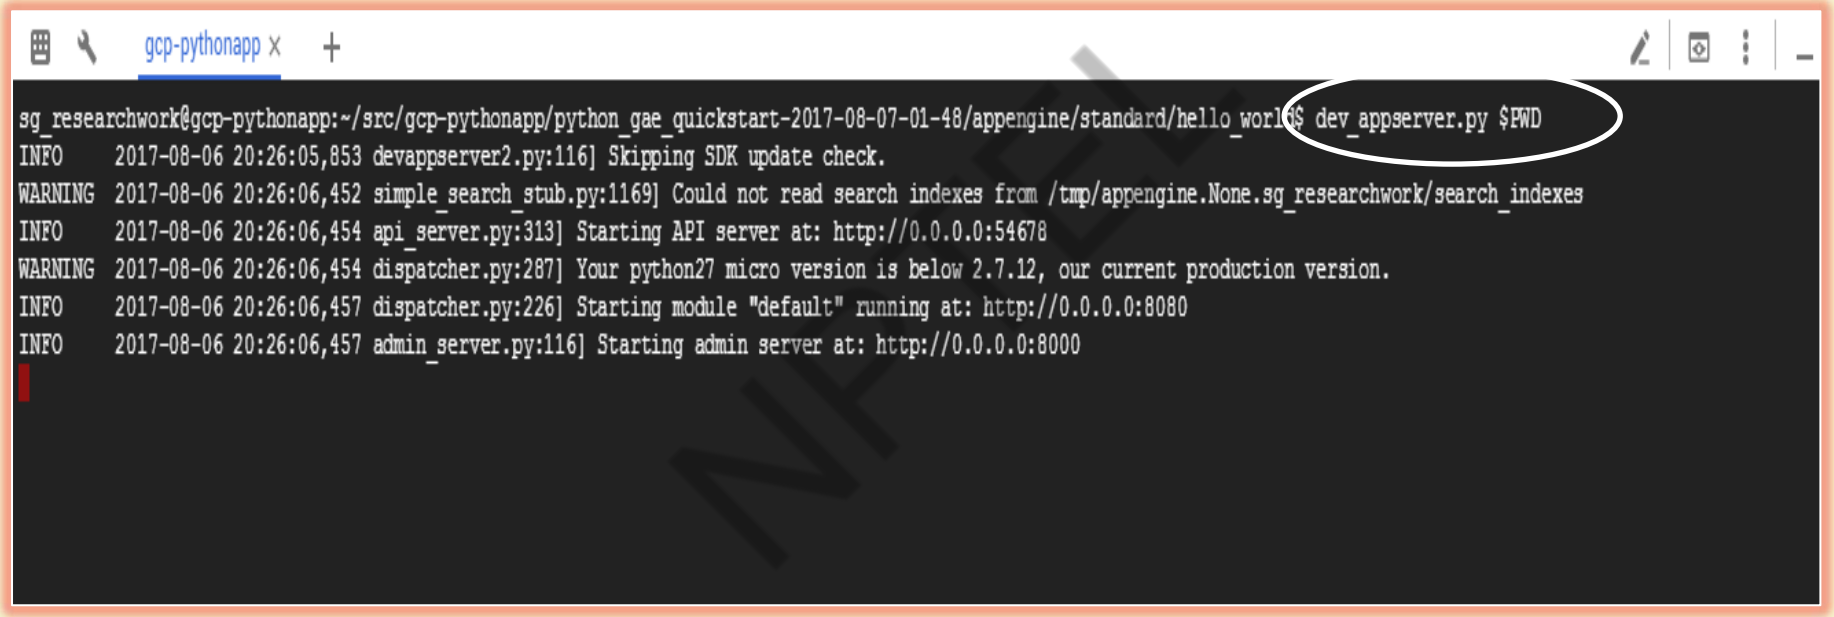
#
#     http://www.apache.org/licenses/LICENSE-2.0
#
# Unless required by applicable law or agreed to in writing, software
# distributed under the License is distributed on an "AS IS" BASIS,
# WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied.
# See the License for the specific language governing permissions and
# limitations under the License.

import webapp2

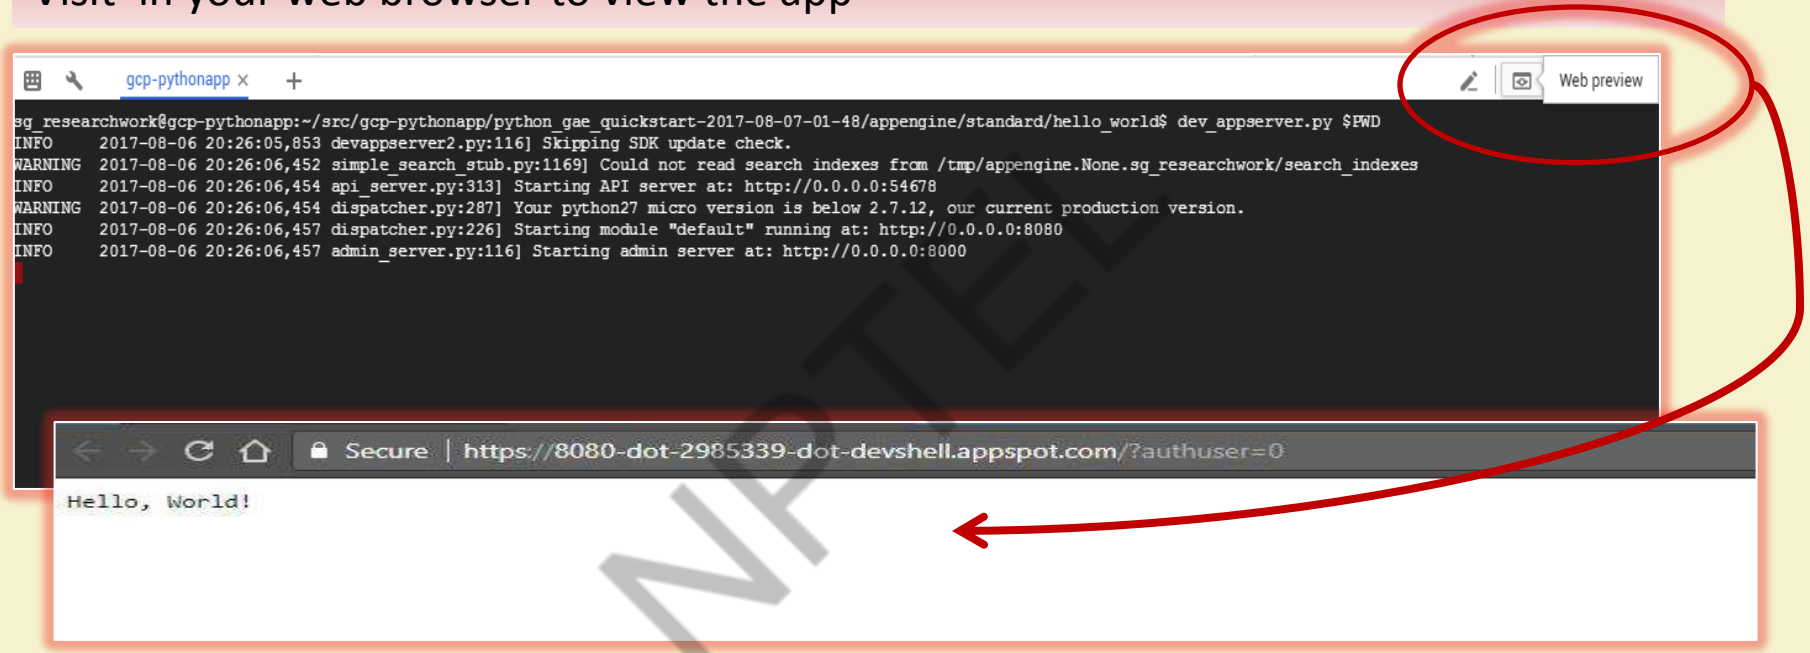
class MainPage(webapp2.RequestHandler):
    def get(self):
        self.response.headers['Content-Type'] = 'text/plain'
        self.response.write('Hello, World!')

app = webapp2.WSGIApplication([
    ('/', MainPage),
], debug=True)
sg_researchwork@gcp-pythonapp:~/src/gcp-pythonapp/python_gae_quickstart-2017-08-07-01-48/appengine/standard/hello_world$
```

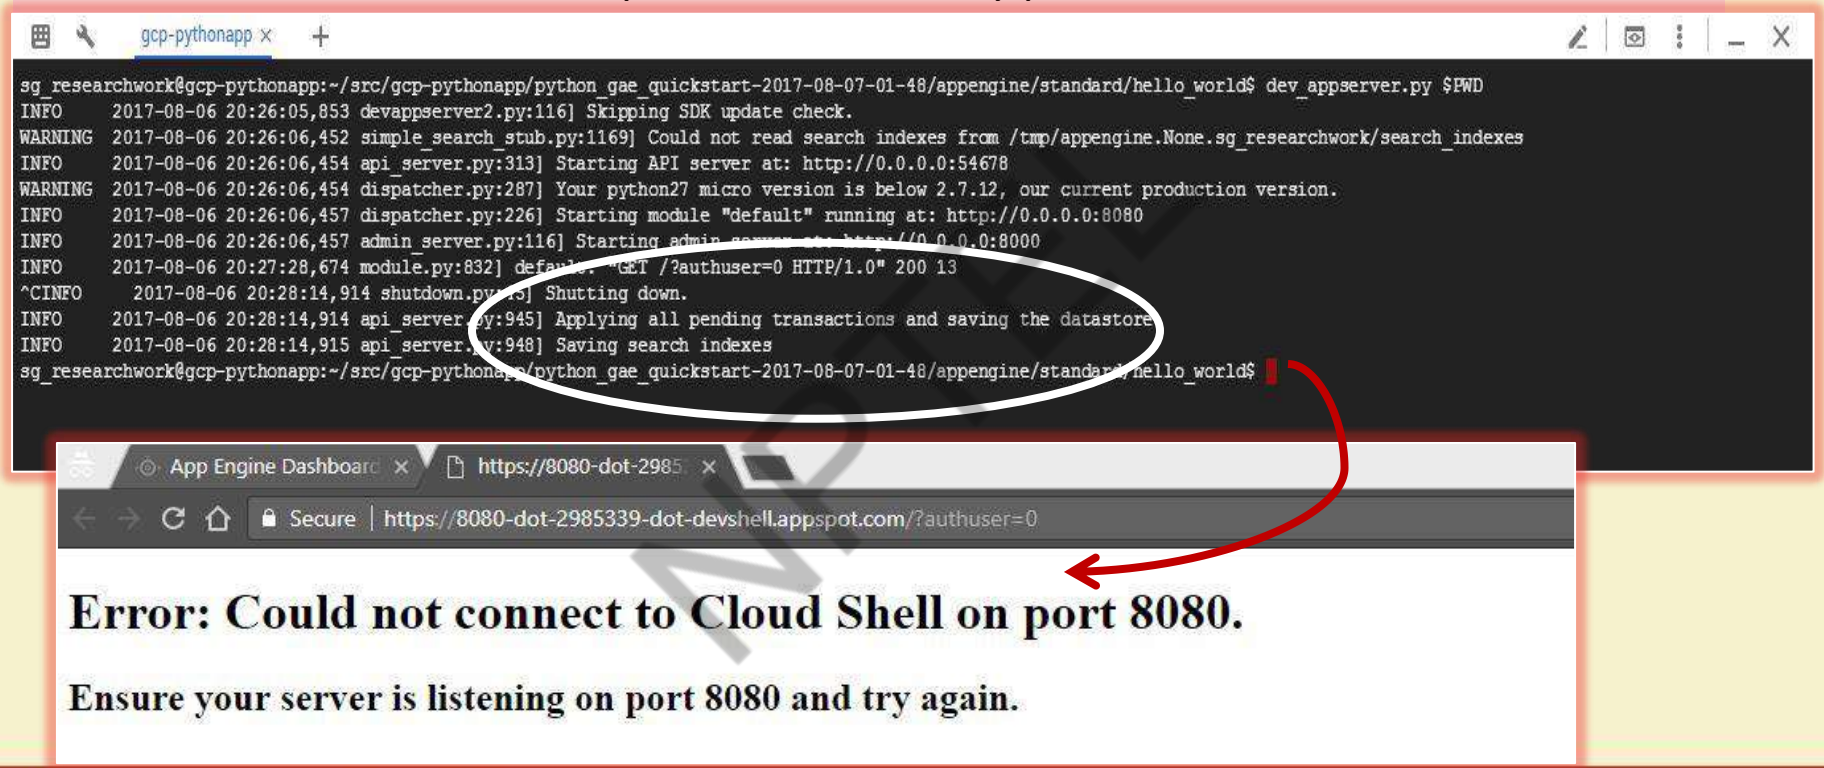
vi) From within the hello_world directory where the app's app.yaml configuration file is located, start the *local development server :* **dev_appserver.py $PWD**



Visit in your web browser to view the app

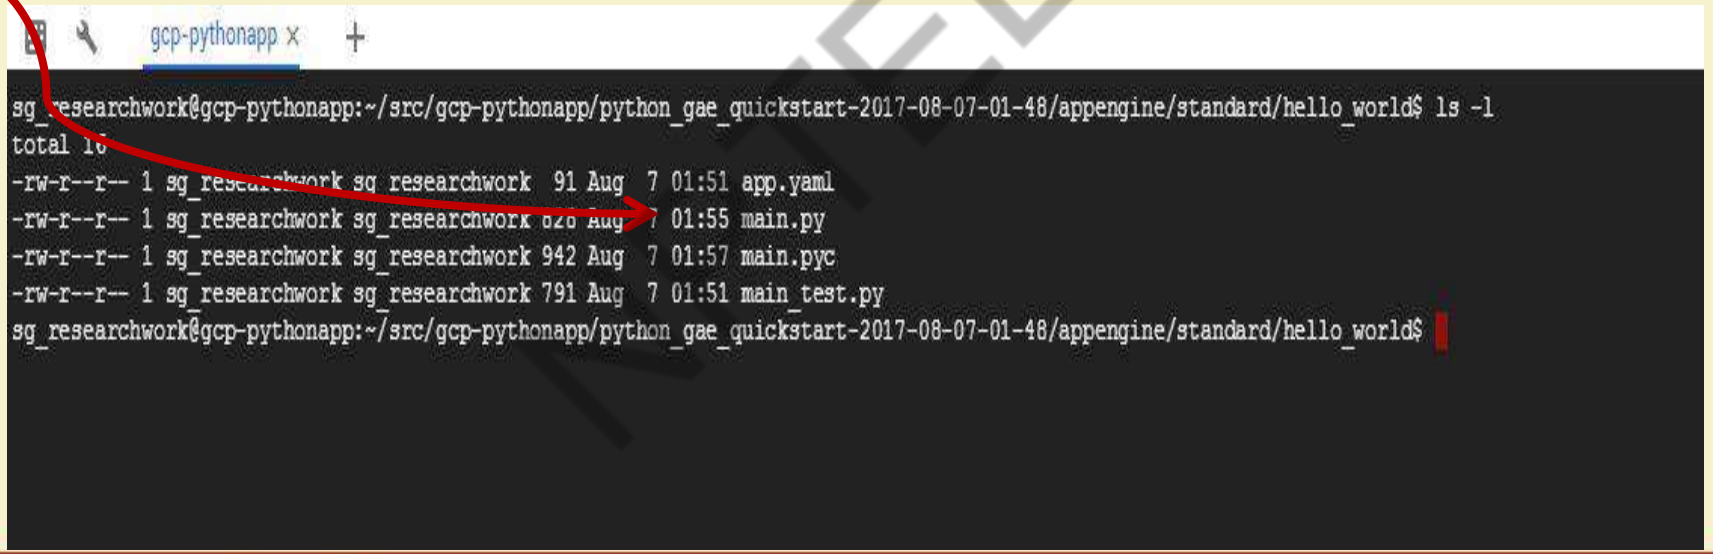


You can shut-down the development server at any point!



You can leave the development server running while you develop your application. The development server watches for changes in your source files and reloads them if necessary

Edit main.py

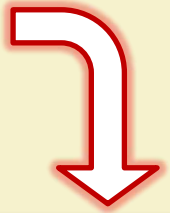


Edit main.py

```
import webapp2

class MainPage(webapp2.RequestHandler):
    def get(self):
        self.response.headers['Content-Type'] = 'text/plain'
        self.response.write('Hello, World!')

app = webapp2.WSGIApplication([
    ('/', MainPage),
], debug=True)
~
~
~
~
```

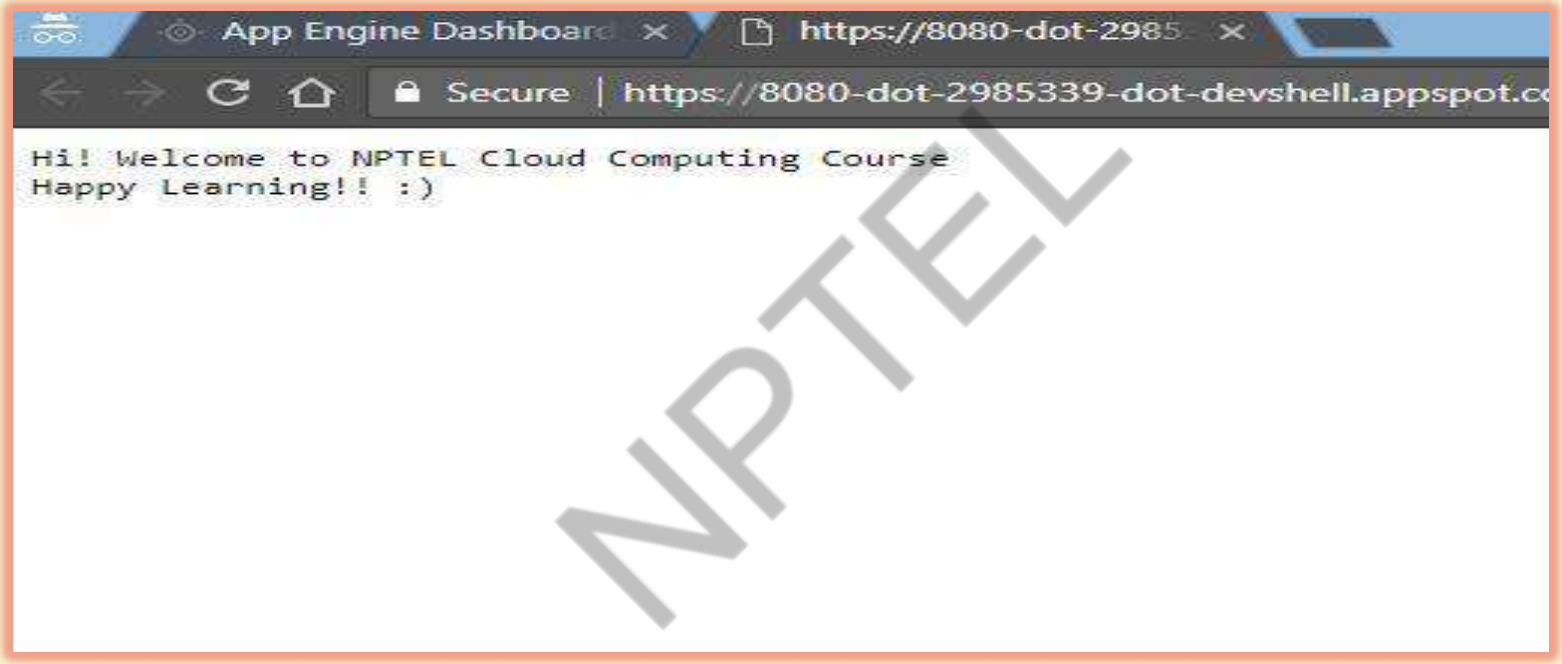


```
import webapp2

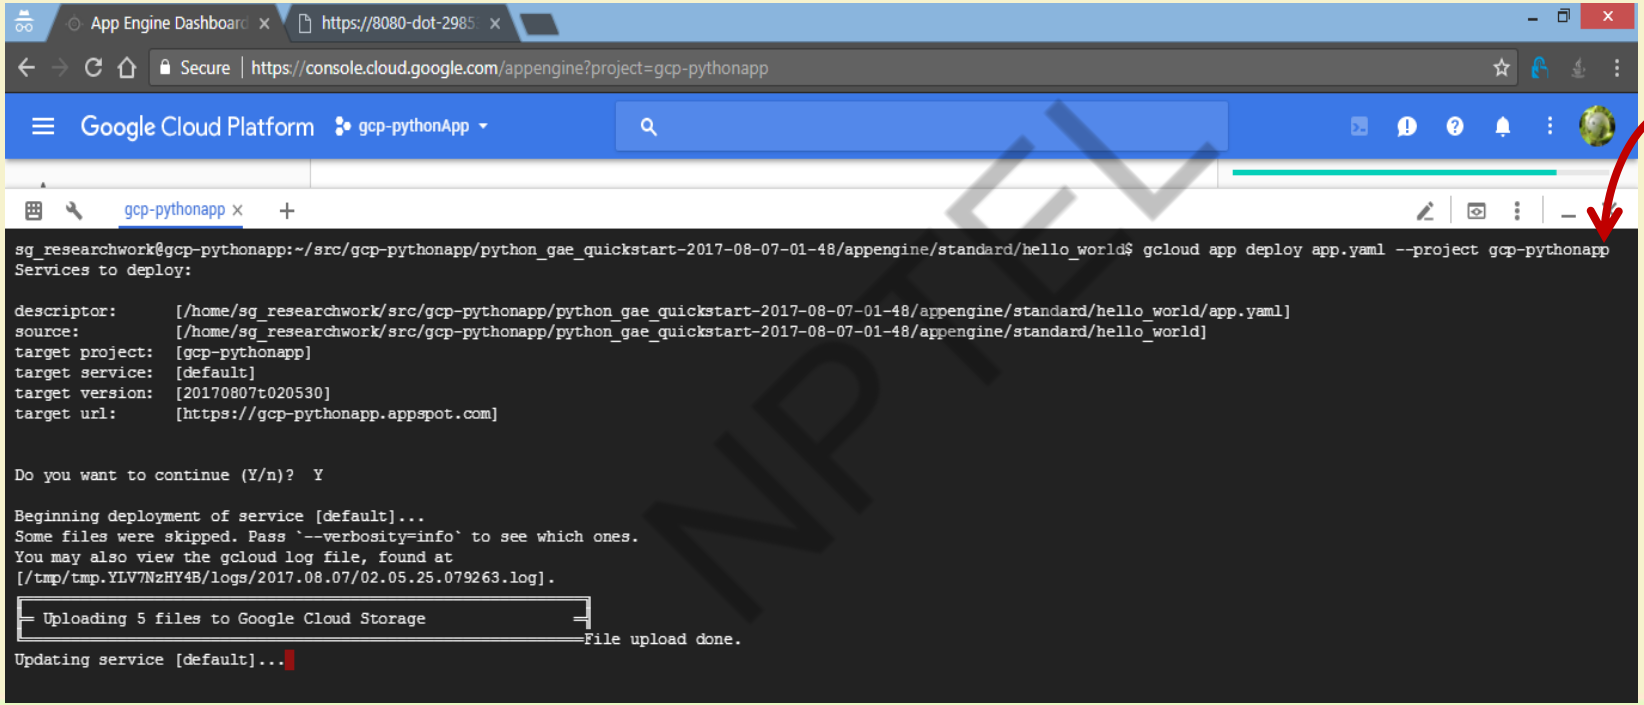
class MainPage(webapp2.RequestHandler):
    def get(self):
        self.response.headers['Content-Type'] = 'text/plain'
        self.response.write('Hi! Welcome to NPTEL Cloud Computing Course\nHappy Learning!! :)')

app = webapp2.WSGIApplication([
    ('/', MainPage),
], debug=True)
~
~
```

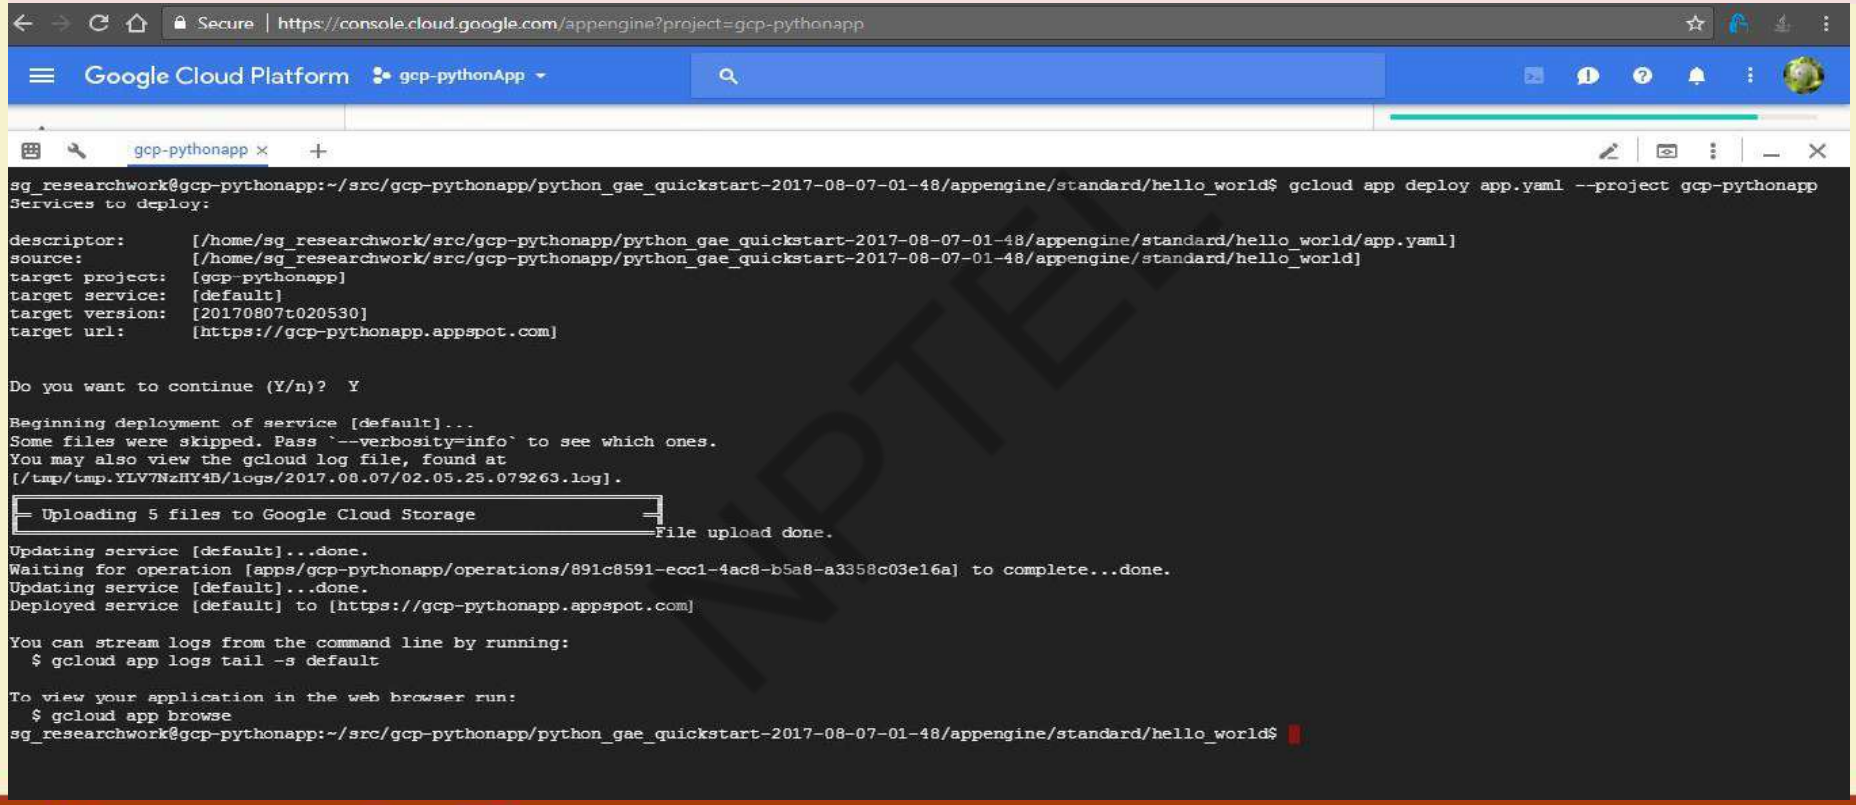
Reload the web-page



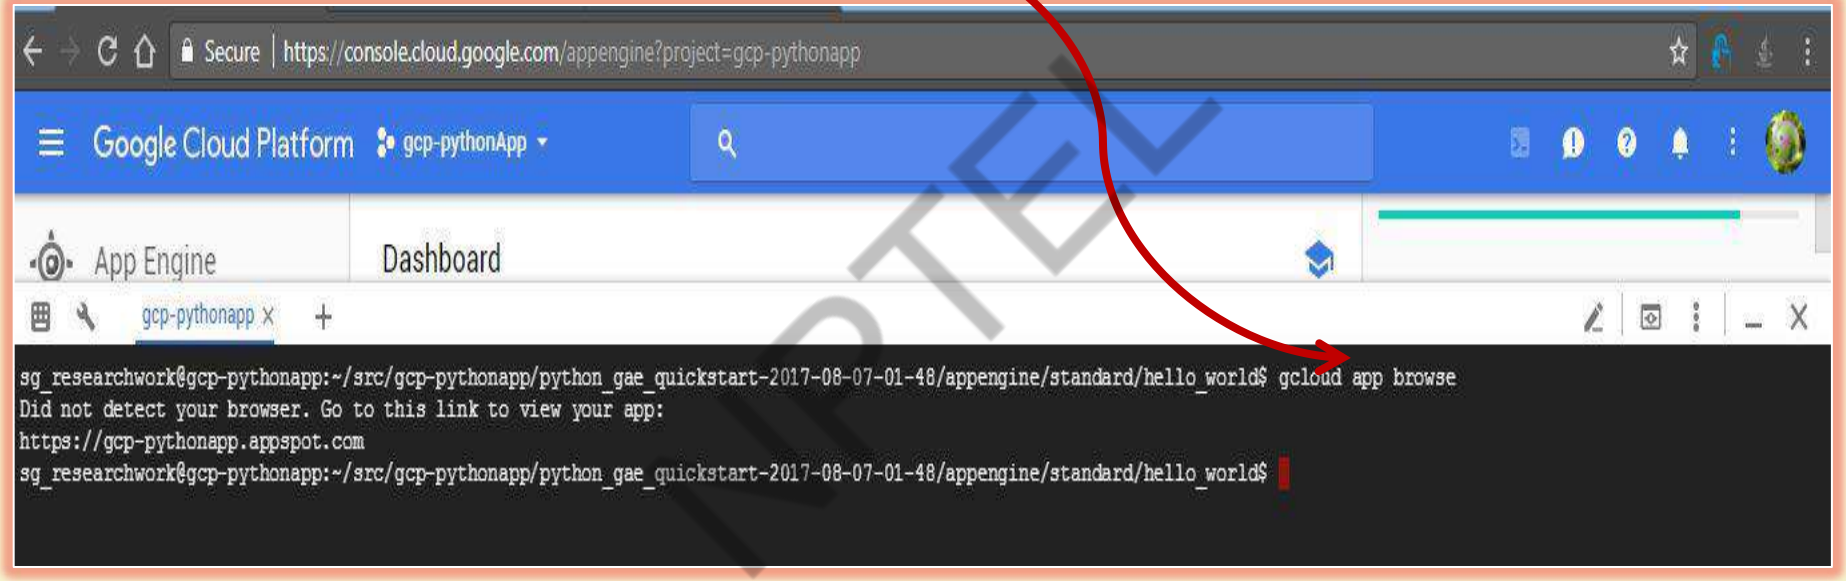
Now deploy your app to App Engine : *gcloud app deploy app.yaml - - project gcp-pythonapp*



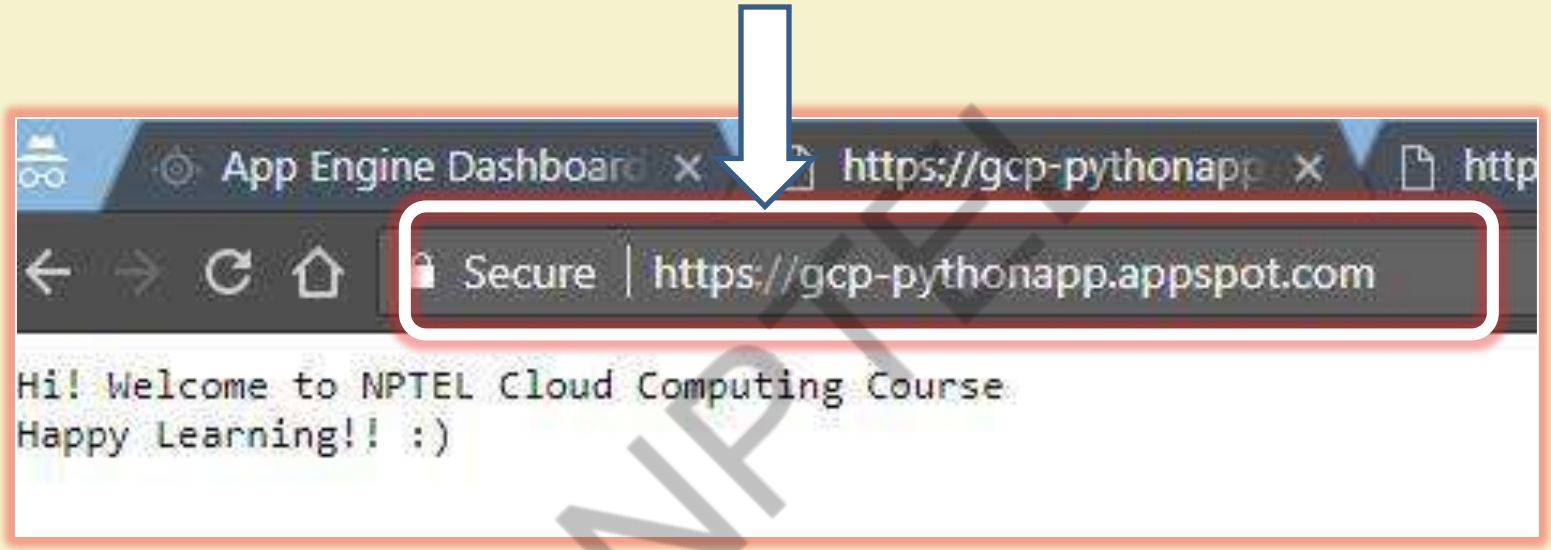
Now deploy your app to App Engine : *gcloud app deploy app.yaml - - project gcp-pythonapp*



View your application : ***gcloud app browse***



View your application : ***gcloud app browse***



You have successfully deployed an web-app!
